ARTICLE INFO

Keywords:
Environmental reporting, Oil & Gas Industry of Pakistan, Content Analysis

This paper investigates to what extent Oil and Gas (O&G) companies in Pakistan report on environmental protection activities. Using a content analysis approach, environmental reporting (ER) in 13 companies’ annual reports and websites are investigated over a five year period (2010-2014) following the guidelines issued by Securities Exchange Commission of Pakistan (SECP). Results reveal that the majority of the companies were found to have a low level of ER. However, since the introduction of SECP’s voluntary guidelines, the level of ER increased during the sample study period. Companies that issued a stand-alone report were found to have higher levels of disclosure on their environmental protection practices. This study recommends that management engage with internal and external stakeholders with their environmental management practices. The results may also be beneficial to the government as they provide reporting guidance and stock exchange regulations regarding the obligatory dissemination of environment-related information.

INTRODUCTION

Oil and Gas (O&G) are important resources and many developing countries are rich in these natural resources (Alazzani & Wan-Hussin, 2013; Bowrin, 2013). However, several accidents in the O&G industry have damaged the natural environment, wildlife and local human populations. For instance, the Bhopal disaster in 1984 killed more than 15,000 people and left thousands injured after deadly gases were released into the atmosphere as a result of an explosion in a defective tank. In 2010, an explosion at a BP drilling rig in the Gulf of Mexico killed eleven people, and leaving 17 injured, thus resulting in an extensive oil spill continuing for 86 days. In 2003, an oil spill in Pakistan was found to be a major cause of illness amongst thousands of people near the shores of Karachi, and this caused serious environmental problems (Janjua, Kasi, & Nawaz, 2006). Moreover, industries discharge poisonous waste chemicals directly into the streams, endangering lives and biodiversity (Ullah, Malik, & Qadir, 2009). As a result of such instances of environmental damage, inspections of the activities of oil and gas companies have been initiated (Peck and Sinding, 2003) to ensure that the environment is protected and natural resources are preserved. However, the reporting of environmental issues has also increased as a consequence of various influencing factors, including pressure from stakeholders (R. Gray, Kouhy, & Lavers, 1995; Sarkis, Gonzalez-Torre, & Adenso-Diaz, 2010). In the wake of such pressures, companies respond by providing voluntary environmental related information, and in particular, the O&G industry was found to be giving more information due to the high possibility of negative impact on the environment by its operations (Kirat, 2015). There is now a trend to investigate the disclosure practices of companies. Despite the fact that ER has been intensively investigated in developing countries now (Belal, 2000; Chatterjee & Mir, 2008; Sumiani, Haslinda, & Lehman, 2007; D. Villiers & Barnard, 2000), there is limited evidence on the South Asian region. Kemp and Vinke (2012) assert that in South Asia the evidence on corporate social responsibility practices is limited as the majority of the previous studies targeted Bangladesh and India while ignoring some geographically and economically important nations such as Pakistan. Although, a small number of studies have investigated reporting practices in Pakistan recently, (Kemp, L. J., and Vinke, 2012; Naeem & Welford, 2009; Nazir, 2010; Sharif & Rashid, 2014) none have investigated the ER practices of Pakistani companies in general and O&G companies in particular. On this note, our study explores the O&G industry in the South Asia region, namely, Pakistan. This particular industry was selected because it has a greater impact on the environment as compared to any other industry. Additionally, extractive industries might be embracing reporting practices to legitimise their practices since they have a greater impact on the environment, which makes them an interesting case to be explored.

This study contributes to the literature in the following ways: 1) it adds evidence to the literature from a developing country from a region (South Asia), where there is limited evidence on ER and hence complements the current focus, which is mainly on developed countries or some transitional economies such as Malaysia. 2) It extends the literature on disclosure practices in Pakistan, particularly environmental disclosure in an environmentally sensitive industry. 3) It captures the findings from various sources of ER that companies use for disclosure. 4) It assesses the impact of voluntary regulation issues by SECP (2013), with a focus on whether or not this has had an impact on environmental reporting practices.

The paper is organised as follows, the next section explores the relevant literature on ER, focusing on ER in developing countries. It will then outline research procedures, in relation to the GRI-index, sample, unit of analysis and categorisation, used to analyse the content of company reports and websites. It will then discuss the analysis of selected companies’ ER practices, concluding that ER is still low and undergoing development in
the O&G industry of Pakistan, and suggesting that governmental and non-governmental organisations should increase pressure on companies to be more transparent.

Theoretical Framework - Legitimacy theory
Legitimacy theory has been used extensively to discuss companies’ ER practices (Nik Nazli Nik Ahmad & Haraf, 2013; Cho & Patten, 2007; Clarkson, Li, Richardson, & Vasvari, 2008; Deegan, Rankin, & Tobin, 2002; Hughes, Anderson, & Golden, 2001; Iatridis, 2013; Reimann, Ehrgott, Kaufmann, & Carter, 2012). Previous studies have discussed the four strategies of Lindblom (1993) that corporations can use to legitimise their existence by voluntarily reporting environmental information. They are: 1) Educate and inform via reporting – the company change and reports the actual facts. 2) Reporting to change the perception of society – No changes in the organization but reporting on what it performs. 3) Reporting to control perceptions of society – more emphasis on the positive news while ignoring the negative news. 4) Reporting to change external perceptions - expectations are regarded as being unfair. Lindblom’s strategies have been applied extensively to describe companies’ reporting practices. For example, a study conducted by Cong and Freedman (2011) concludes that companies with good governance aim to project an image of being good corporate citizens, while their actual performance contradicts that image. In addition, they argue, companies focus on projecting a good image on the high-profile issues in order to obtain legitimacy. However, the image and the actions that companies use to influence perceptions are unreliable (Patten, 1992). Similarly, a study conducted by Chu (2013) in Chinese companies concludes that most of the reporting was found to be neutral or good news, which shows that companies use thief annual reports as tools to legitimise their actions. In addition, this is achieved through manipulation technique which means changing the attention of the public. Furthermore, for example, de Villiers and van Staden, 2006 and Mahadeo, Oogarah-Hanuman and Soobaroyen (2011) found that legitimising objectives may have been served by altering the type and volume of disclosure in order to avoid a legitimacy crisis. Furthermore, Momin and Parker (2013) found that seeking internal legitimacy appeared to be the main motivation for CSRR practice in MNCs subsidiaries in Bangladesh. On the other hand, in regards to the reason behind non-disclosure of environmental information, Antonites and de Villiers (2003) argue that the sensitivity of environmental information was considered as the most important reason for companies choosing not to report environmental related information. In addition, while choosing to report or not to report, companies will make every effort to change their image to obtain stakeholder confidence because sensitive information can have a negative impact on the business and therefore there is a reluctance.

In addition, Branco and Rodrigues (2008) argue that companies alter their reporting practices when the face environmental disasters, such as oil spills, which might bring them under public scrutiny. Moreover, companies in a country such as Pakistan may be conscious of negative publicity and in order to avoid such a crisis, they tend to give information about their environmental performance. Nevertheless, over recent years ER has developed as an important feature of corporate social responsibility. It is now customary for many companies, including companies in extractive industries, to exhibit their commitment to sustainable development (Peck and Sinding, 2003). The basic aim of ER was to display a corporation’s commitment to the environment. However, ‘the debate has shifted and now the main goal of ER has to be to demonstrate the company’s environmental performance. It is this shift that needs to be tested in such a region (South Asia, Pakistan) where environmental problems are increasing rapidly.

Literature Review
Excessive emissions and environmental carelessness create risks for the health of individuals and the natural environment, also the negative
corporate image created by these issues can have a serious impact on companies’ profit (see, for example, Adams, Muir, & Hoque, 2014; R. H. Gray, Owen, & Adams, 1996; Milne & Gray, 2012; Tilling & Tilt, 2010; Tilt, 2018). This is not claimed only by academics, but also by some well-known firms such as Deloitte (1993), ACCA (2013), KPMG (2015), who have issued reports that emphasise the growing public demand for increased environmental disclosures. Many corporations have moved business operations to South Asian countries to take advantage of less stringent laws and to have the benefit of an abundance of natural resources (Schuster, Lund-Thomsen, & Kazmi, 2016). Naeem and Welford (2009) conducted a comparative study of corporate social responsibility through an investigation of written policies of both local and multinational corporations operating in Pakistan and Bangladesh. They concluded that both countries face severe issues associated with the degradation of the environment and the exploitation and abuse of labour and the infringement of human rights. Likewise, a study conducted by Bhutto, Bazmi and Zahedi (2011) highlight that Pakistan is suffering from deforestation due to land developments and business expansion. In addition, the spillage of oil in the sea and gas explosions are the most prolific problems for these companies around the world, particularly in developing nations. As such major incidents were witnessed in the United Arab Emirates, India, Kuwait, Libya, Mexico and Pakistan. For instance, Meo et al., (2008) examined an incident of Greek oil tanker spillage along the shores of Karachi, Pakistan, the study concludes that the event impacted the lungs of the workers who were exposed to a crude oil spill. In addition, such events not only cause deaths but also impact companies’ legitimacy.

Under such circumstances and in response to pressure from stakeholders for better reporting of environmental performance, companies have started to provide information regarding their environmental risks to avoid any legitimacy crisis. For example, Cho and Patten (2007) argue that companies use disclosure as a tool to minimize the exposure to social and political pressures, and companies that damage the environment are more likely to make more environmental disclosures to gain legitimacy. In addition, the previous studies focusing on ER in developed economies have suggested that the main reason behind such reporting is to obtain legitimacy (Islam & Deegan, 2010; Mitchell & Quinn, 2005; Tilling & Tilt, 2010). In a similar vein, a few studies focusing on developing countries have also highlighted that the main reason behind company disclosure is to gain legitimacy (see Chatterjee & Mir, 2008; Chu, 2013; Sahay, 2004). However, Ahmad and Haraf, (2013) suggest that legitimacy theory is of limited benefit when explaining the nature and reason for disclosure in the Malaysian context. Whether or not this is true in the context of Pakistan still needs to be investigated, particularly in the O&G industry.

A number of studies have found that the level of ER in developing countries are low and it’s in early stage - evidence from few developing countries in Asia is shown in Table 1.

Table 1 provides an overview of recent studies that investigated ER in various developing countries. The general trend that can be observed is that companies provided inadequate environmental information in their annual reports. The review of studies in the Bangladeshi context indicates a poor state of ER. Over time, both the oldest and the most recen (the year 2016) studies concluded that the level of reporting is low. The studies relating to Malaysia have been conducted relatively recently and the levels of ER are not significantly different from those of any other developing country. Note in particular that a few studies that the level of environmental disclosure in Malaysian companies is low. However, interestingly, studies in the Malaysian context also highlight the reasons behind the disclosure. For instance, companies use reporting as a tool to be seen as sustainable businesses and practice reporting as a tick-boxing exercise. However, Nazli Nik Ahmad and Sulaiman, (2004)

</table>
argues that there is limited support for legitimacy as a reason to disclose on environmental issues. Nevertheless, the government’s intervention by introducing mandatory reporting laws perceived to be a potential solution (Ahmad and Haraf, 2013). Overall, previous literature on ER indicates that the concept of non-financial reporting is gaining importance in developing countries, even though it is still a voluntary practice. In terms of literature on environmental reporting, the investigation of ER has been as yet unexplored in Pakistan, with existing literature examining only corporate social responsibility (CSR) reporting in general. Kemp and Vinke, (2012) found a variation in reporting practices across industries; for example, the level of reporting is greater in commercial banks than in the aviation sector. Chaudhry, Mughal and Zafar (2014) investigated O&G companies of Pakistan and found that companies care about their reputation; hence they disclose to build their green image. Hence, there is a need to examine other industries’ reporting practices. In addition, as extractive industries in developing nations have had a negative impact on the natural environment and the lives of human beings; stakeholders’ demand for information has increased, and there is a need to comprehend O&G companies’ initiatives to protect the environment. The study by Kemp and Vinke (2012) provides useful insights of a country to expand understanding on reporting practices of a developing country. Using the same country sample, our study contributes to the literature by focusing on the environmental aspects of corporate responsibility reporting in an environmentally sensitive industry. In addition, the study investigates longitudinal (2010-2014) rather than just relying on a single year. Therefore, the current study aims to investigate the current state of ER in the Oil and Gas industry in Pakistan.

METHODS

Many previous studies (see (Dutta and Bose, 2007; Gray et al., 2001; Hackston and Milne, 1996; Hassan et al., 2013) have used content analysis technique to investigate reporting practices of companies. This study also employs a content analysis approach to examine the extent of ER in annual reports and corporate websites. Content analysis is “a research technique for making replicable and valid inferences from data according to their context” (Krippendorff, 2012). This involves classifying the object under investigation (ER) into categories, on the basis of pre-defined criteria. This method has been used extensively to examine the non-financial reporting in developing countries due to its nature, which assists to observe the trend of companies reporting practices. Therefore, the content analysis as a research method deemed suitable for investigating the ER of O&G companies.

This method requires a few important steps to implement its process; (1) the selection of sources (2) the selection of a unit of analysis and (3) theme identification.

Sources of information: CR, stand-alone reports and company websites were selected as sources of ER information. As a result, 60 CR reports, 9 stand-alone reports and 12 corporate websites were investigated to determine O&G companies’ ER reporting practices. The company reports were obtained from the company’s official website, usually in the public relations and archive sections. Previous studies, when using the content analysis approach, relied on a single source (annual reports) of data collection; however, our sample includes different sources of reporting: corporate reports (CR) and the website, and longitudinal period in their current method. Wilmshurst and Frost, (2000) argue that companies use additional mediums of reporting, such as CR, stand-alone report and websites. A longitudinal approach was taken in order to analyse differences in reporting practices and the impact of pressures from stakeholders on companies’ ER over a 5 year period between 2010 and 2014. This period was interesting in Pakistan’s business context because SECP approved CSR Voluntary Guidelines in 2009 and a comprehensively updated version was launched in 2013 that also guides companies to report on environmental matters. Therefore, this period was
selected to assess the impact of voluntary guidelines on the volume of ER in O&G companies in Pakistan.

**Unit of Analysis:** The study focuses on two types of measures: a) to measure what is disclosed and b) to measure the level of ER based on the number of words disclosed on environmental related information. Previous studies on CSR reporting have experimented with different units, mainly, words, sentences and pages. There have been debates around what works best to investigate such a complex phenomenon because companies not only make narrative disclosures but also use images and infographics. The pages (devoted to ER in an annual report) were used as a unit of analysis, based on work of (Campbell, 2004; Deegan & Gordon, 1996; Gao, Heravi, & Xiao, 2005; Hassan & Kouhy, 2013) because a page provides a significant amount of detailed description than number of words and sentences. In addition, measurement based on number of sentences is incomplete because they do not consider pictorial reporting and the majority of the companies’ reports do contain images of their environmental responsibility. Nevertheless, for corporate websites, we counted the number of words written on environmental issues to determine the companies reporting practices as number web pages does not always consist of pages.

**Themes and categories:** To identify the themes from the sources (annual reports and the website), this study followed the SECP’s guidelines that issued voluntary guidelines namely, Companies (corporate social responsibility) General Order in 2009 and CSR Guidelines in 2013. The purpose of these guidelines was to encourage responsible business practices in Pakistan. In this regards, Javaid Lone, Ali, & Khan, (2016, p. 786) state that “these guidelines induce organizations to have a CSR policy endorsed by the board of directors that reflects their understanding and commitment toward CSR reporting”. The guidelines outline key environmental issues that companies in the Pakistani context need to focus upon, such as energy conservation, environmental protection, water management and health and safety. Such issues have increasing prominence in Pakistan due to their negative impact on the environment, species and human life. As such, it is important to assess the extent to which Pakistani O&G companies actively engaged with these issues.

After an appropriate comprehension of the content analysis approach by exploring past studies that utilised this method, we initiated the full content analysis process, which prompted a scan of each report issued by the selected firms. This was undertaken with great consideration in order to enable the cautious decision to be taken regarding whether a specific item is relevant to any of the environmental categories outlined by SECP. Consequently, this reduced the subjectivity in determining relevant items. In addition, the context of the text was thoroughly read to confirm the relevance of information to environmental aspects. After reading the text from the annual report the researcher assigned a label indicating the category considered in the study and counted for content analysis. If an indicator was available in the selected source, that item was considered as being ‘disclosed’ and given a value of 1. If no information was available, the item was considered as being ‘non-disclosure’ and given a value of 0. After analysing the content of a particular year was completed, the same procedures were employed for the other years in the sample. This procedure was repeated for every incidence of CSRR for each company – a thorough reading and then coding as per the SECP indicators. Each indicator and source were investigated carefully to reduce instances of error. In order to reduce instances of inconsistency and/or omission while undertaking content analysis, the double review was performed in order to ensure the reliability of the content analysis process (Krippendorff, 1980). Two researchers independently analysed the reporting mediums to test the instrument and identify discrepancies. This then allowed for the comparison of the results of two coders, the results of both coders were compared, and few minor discrepancies were noted, such as slight variation in the theme identified, however,
the majority of the results were identical and this indicates that the results are replicable.

The sample includes only Pakistan O&G companies, listed on the Karachi Stock Exchange, due to their high level of potential negative environmental impact. Three further criteria were used to select the sample group, following Alazzani & Wan-Hussin’s (2013) study: 1) companies within O&G sector of Pakistan (total 13 O&G companies operate in Pakistan). 2) companies who have made a commitment to consider the environment (all companies are encouraged to include environment information by the SECP). 3) availability of their reports (only one firm (Sui Southern Gas Co Ltd ) was excluded due the missing annual reports and 12 firms were included in the sample (see Table 2). As a result, out of 13 companies in Pakistan’s O&G industry, 12 were selected for analysis (see table 2), with one being excluded due to lack of availability of reports.

RESULTS AND DISCUSSION

Oil and Gas (O&G) are important resources and many developing countries are rich in these natural resources (Alazzani and Wan-Hussin, 2013). Table 3 provides descriptive statistics of the volume of ER in each year. There has been a significant increase in the volume of ER in the O&G sector of Pakistan since SECP announced (2009 and 2013) voluntary guidelines.

Figure 1 indicates that almost all the companies in the Pakistani O&G sector disclosed environmental and health and safety information. Similar results have been found by (Kilian & Hennigs, 2013), who argue that “companies in controversial industries are more active in CSR communication” (p 2). This is often attributed to a number of incidents in the O&G sector, forcing companies to change their CSRR practices. This is supported by Tilling & Tilt (2010) who found that after the incident the sample companies issued more environmental information in their annual reports than before the incidents. Their findings are all in line with Islam’s and Islam’s (2011) study. It can be argued that disclosing environmental information gives them environmental legitimacy because disclosure is often used as a tool to build a better corporate reputation (Branco & Rodrigues, 2007; Dragomir, 2010; Friedman & Miles, 2001; Kilian & Hennigs, 2013). Their study’s findings are in line with this study in their assertion that large O&G companies disclosed more CSR information than their smaller counterparts.

Table 4 the findings show that the volume of general ER had increased during the period 2010-2014. All selected companies engaged in ER in various sources. The reporting trend rises gradually each year, consistent with the finding of (Belal 2000; Imam 1999; Ullah et al, 2014). This trend may be as a result of increasing pressure from stakeholders on companies, as ER becomes an important trend within developing countries. It may also be related

</table>
to the government pressurising companies to be more transparent (Sari & Tjen, 2016). For example, the introduction of the Companies (corporate social responsibility) general order in 2009 and 2013 by the Securities and Exchange Commission Pakistan (SECP) may have encouraged companies to disclose information regarding “environmental protection” practices. It is also noted in Adefemi’s (2018) study that securities and exchange commission’s regulations had an impact on increased disclosure practices of Nigerian firms. According to previous studies, (Sari & Tjen, 2016) companies perform environmental disclosures as a legitimizing tool and poor environmental performance leads to a higher level of reporting on environmental aspects.

However, despite an increase in the trend, ER is underdeveloped in Pakistan’s O&G industry in comparison to developed countries. This is consistent with (Nik Nazli Nik Ahmad & Haraf, 2013; Djajadikerta & Trireksoni, 2012; Dutta & Bose, 2008; Othman & Ameer, 2010; Qi et al., 2012; M. Ullah, Yakub, Hossain, Ullah, & Musharof, 2013), our result suggests that the level of ER remains low.

It can be expected that companies tend to disclose on their websites with the intent to engage with stakeholders. However, the level of reporting is at a low level, and lacking in detail. In the majority of instances, ER related information found to be in a specified section on the website - namely “Corporate social responsibility”, “Sustainability” and “Health and safety”.

This indicates that using a guideline such as GRI as well as stand-alone reports can enhance companies’ level of reporting. In addition, these guidelines can also show companies, particularly in developing country, a way forward to make the better stakeholder engagement. The volume of reporting was counted from two sources namely, annual financial reports and stand-alone reports. When companies issue a stand-alone report, the volume of reporting increases significantly. In the case of oil and gas companies, 4 companies were found to be using reporting guidelines and issuing stand-alone reports as well. Studies suggest that oil and gas companies have a greater impact on the environment and society and for companies in the oil and gas sector maintaining legitimacy is essential (Alazzani & Wan-Hussin, 2013; Berthelot, Coulmont, & Thibault, 2013; Eljayash et al., 2012; Kirat, 2015). It can be argued that in order to gain stakeholder’s confidence, companies in this sector dedicate attention to their reporting strategies (Sari & Tjen, 2016). One of those strategies is to issue a stand-alone report to increase the volume of disclosure and other tactics involve using international guidelines, such as GRI, to provide a detailed set of information on their CSR performance. This is in line with findings of Alazzani and Wan-Hussin’s (2013) study, which found that companies made a reasonable effort to disclose in accordance with the GRI guidelines, as these guidelines provide a robust and comprehensive tool for reporting. In addition, they argue that the voluntary adoption of GRI by O&G firms enhances transparency, credibility and comparability. The companies in this environmentally sensitive sector use proactive strategies to gain organisational legitimacy because in the past a few environmental disasters have been tied directly to the oil and gas sector, which makes it

more vulnerable to threats to its legitimacy. Hence, companies use various reporting practices to make a positive impact on their stakeholders.

Discussion
This study concludes that despite the fact that it is not mandatory, most Pakistani O&G companies report some environmental information. The state of ER in Pakistan’s O&G industry is not very different to that of any other developing countries, as the majority of companies provided low ER in their various sources of communication such as annual reports and websites. In addition, even though, the most common medium that is being used to present environmental related information was found to be CR, the level of reporting is higher in the stand-alone report and using guidelines significantly enhances companies’ disclosure. For example, NRL provided a sustainability report for the first time in 2014. This may have been prompted by the company winning an annual award for the best report, organised by ACCA-WWF in Pakistan. Such initiatives encourage companies to improve reporting practices, particularly winning such competition provides the company with a recognition among various stakeholders among the society (Sari & Tjen, 2016).

Even though, the SECP notification (2009) states that “obligations under the law- (1) Every company shall provide descriptive as well as monetary disclosures of the Corporate Social Responsibility activities undertaken by it during each financial year (p. 1)” however the contents and statements about reported aspects of environmental activities tend to be general and narrative, and particularly amongst local companies there was no evidence of monetary disclosure about the environmental performance. In line with Cho, et al., (2007), the majority of companies (10) included only descriptive information, explaining what they do in relation to the adoption of policy, goals and objectives to protect environment, rather than providing meaningful information about what, how and why such activities were performed and any associated expenses. This supports previous studies (see Fernando, 2014; Imam, 1999; Kemp, L. J., and Vinke, 2012) that found environmental disclosure to be general and descriptive in nature.

MANAGERIAL IMPLICATIONS
We argue that Pakistan’s O&G companies need to report on environmental performance voluntarily to inform various stakeholders. Company management is charged with engaging a wider array of stakeholders and this study shows that ER is a powerful tool for management to consider. Since, it is believed that ER not only provides stakeholders with the ability to make the right decisions but also helps companies to compare its environmental performance. The results of this study have potential implications for managers who may consider companies’ ER as being an indication of companies’ environmental performance. In addition, the results are useful as an evidence to convince companies’ management to be transparent and engaged with stakeholders as it provides a better reputation and gains stakeholder’s confidence. The results may also be used by the management for focusing on reporting guidelines and stock exchange regulations to disseminate environment-related information robustly. Du and Vieira (2012) suggest a solution to this question: Despite a wide variety of CSR initiatives and prevalence of cross-sector partnerships, oil companies need to abandon the “CSR as public relations” mentality, and instead work proactively in minimizing the negative externalities of their business operations, and take a long-term approach to CSR by investing substantially in renewable energies and going beyond simple financial donations in their cross-sector partnerships (p. 425).

CONCLUSION
This study investigated ER in O&G industry of a developing country where environmental issues are increasing, namely, Pakistan. The findings of the current study suggest an increasing trend in CSRR among O&G firms in Pakistan; however, the level of ER remains low as is the case in many other
developing countries. The main disclosure item observed was “environmental protection” and “health and safety” and it can be argued that companies in the O&G sector are more active in disseminating ER related information and this can be attributed to claims made by the legitimacy theory and a number of incidents in the O&G sector, forcing companies to change their CSRR practices. The study has many limitations. Focusing only on O&G companies, the results cannot be generalised to companies in other industries. In addition, it is possible that errors or omissions of relevant information may have occurred when scoring the disclosure, despite taking all measures to avoid this. Future researchers may consider using a larger sample, including companies in other sectors, or drawing comparisons with companies in developed and other developing countries. Moreover, an in-depth study investigating the perceptions of managers dealing with environmental activities and its reporting would be useful.
