The ‘Horse-Meat’ Scandal: Illegal activity in the Food Supply Chain.

Abstract

Purpose: Food supply chain theory and practice generally assumes that the business practices and processes involved are ethical, legal and value adding when this is not always so, as demonstrated by the ongoing 2013 Horsemeat Scandal. Although it is ostensibly a UK based affair it encompasses the meat processing industry across Europe. We thus examine supply chain criminality and highlight ‘scandal scripts’ which amplify underlying issues.

Approach: A systematic review of extant literature on the scandal adds to that body of work, updating the existing narrative to include a detailed analysis of ‘convicted ‘industry insiders’, highlighting supply chain issues involved in the frauds. Micro-stories of businessmen involved are presented to enable an empirical exploration of their illegal involvement in the meat trade. Using storied data from accounts of the scandal as contemporary examples, emerging themes and issues are outlined through a mixed methods qualitative approach consisting of ethical covert research, utilising documentary research strategy underpinned by Narrative Inquiry.

Findings: Media coverage perpetuated various myths notably that the fraud was carried out by ‘shadowy’, Eastern European ‘Mafia figures’ exploiting the extended food supply chains. The analysis is aided by the use of media hypothesis. Far from being a mafia inspired fraud the criminal activity was organized in nature and committed by insider businessmen. The findings demonstrate that supply chains are complex and require an understanding of storied business practices including the ethical and illegal.

Research implications: From an academic perspective there are implications such as the dearth of academic research and policy-related studies into food fraud possibly because of the difficulty in obtaining data because of access to such enterprises and entrepreneurs necessitating reliance upon documentary sources and investigative journalism.

Practical implications: There are distinct policy implications particularly the need to legislate against international criminal conspiracies and everyday ordinary organized food frauds perpetuated. Lax penalties do little to prevent such crimes which need to be taken more seriously by the authorities, and treated as major crime. In formulating food laws, rules and regulations, greater cognizance should be taken to consider how supply chains in the food industry could be better protected from predatory criminal actions.

Originality: This novel qualitative study will enable academics and practitioners to better understand illegal enterprise, food fraud and risk management from both operational and supply chain perspectives and will be useful to investigators by furthering our understanding of entrepreneurial practice and morality in the food industry.

Key Words: Ethics: Risk Management: Food fraud; Illegal Food Supply; Illegal Enterprise; Abattoir Owners.
1. Introduction.

There is a growing literature on criminality and food-fraud in the supply chain (McElwee, Smith and Lever, 2017). Additionally, in the wake of the Horse-meat scandal of 2013 [aka Horsegate] (Premanandh, 2013; Agnoli et al, 2016), and despite an increasing literature on food fraud (Shears, 2010; Rouvière, 2012; Manning and Soon, 2016; Manning, et al, 2016; Koubová, Samková and Hasonová, 2018) such research seldom features in supply chain journals (Oglethorpe and Heron, 2013; Simangunsong, Hendry and Stevenson, 2016) nor in academic literatures on farming, food policy, operations and food production management. This is an obvious research gap to be filled. Simultaneously, media reports and evidence from official government reports suggest that there has been an increase in food related criminal activity since the global financial recession of 2007-08 (see Smith, 2017; McElwee et al 2017; Fassam and Dani, 2017 for more in-depth discussion).

The commonly held perception of food fraud is that it is committed by organized criminal gangs and mafias (as suggested by Lord, Elizondo and Spencer, 2014). This article and embedded case studies pushes the boundaries of supply chain management research and practice by showing that the meat industry and its supply chains, is as open to exploitation and malpractice by criminal gangs as it is to legitimate entrepreneurs. However, the majority of those highlighted in this paper are individual businessmen who cynically and criminally exploit the meat trade for financial gain. Although these individuals purport to sell meat products as genuine through legitimate business channels, the evidence from official data such as convictions, indicate that it is criminal fraud. Moreover, operationally, these business channels appear to be highly organized. In the cases narrated here the majority of firms involved are all registered in the Irish or UK ‘Companies house’ and appear to operate via an extensive network of legal and illegal contacts throughout the UK, Europe and Ireland. Of necessity, our embedded case studies focus on the activities of named and convicted businessmen. The overt inclusion of their names is justifiable because it would not be possible to discuss the scandal without using the names of the individuals and companies involved. This overt/covert paradigm is accepted research practice in qualitative research (Spicker, 2010).
The aim of this study, by investigating the scandal, is to demonstrate that supply chain theory and value chain analysis can be used to better understand the illegal activities of entrepreneurs and businesses as a parallel supply chain. Failures in understanding the nature of food related scandals hinder society from taking appropriate action against increasing levels of food fraud. Moreover, there is a need to challenge the ways in which supply chain criminality is viewed and to acknowledge the existence of supply chain criminality and malpractices. The food industry is a high pressure, high volume, low profit business involving a wide range of entrepreneurial actors, including farmers, small business owners such as butchers and abattoir owners, independent entrepreneurs, large meat processors and supermarkets (McElwee, 2008; Smith and McElwee, 2015). All these stakeholders compete to extract profit from a crowded food supply chain.

Food fraud incidents are invariably labelled as scandals. Elliot (2017) articulates that such scandals have an ‘anatomy’ and utilise alternative scripts and explanations to divert attention from the real causes of a phenomenon. These scripted explanations also act as ‘neutralisation techniques’ (Gottschalk and Smith, 2011) to ensure that damage limitation is achieved by the person, or company, caught up in a scandal. The storylines of such “scandal scripts” have explanatory power and contribute to the creation of “amplification spirals” and “moral panics” (Cohen, 1972). A scandal is defined as ‘An action or event regarded as morally or legally wrong and causing general public outrage’ (Oxford Dictionary). In the farming and food industries, it is common to label such cases as scandals when they are prime examples of criminal entrepreneurship and endemic supply chain malpractices.

In referring to fraud, we utilise the definition from the provisions stated in UK Fraud Act (2006, c.35, 2.):

(1) A person is in breach of this section if he (sic)
(a) dishonestly makes a false representation, and
(b) intends, by making the representation—
(i) to make a gain for himself or another, or
(ii) to cause loss to another or to expose another to a risk of loss.
(2) A representation is false if—
(a) it is untrue or misleading, and
(b) the person making it knows that it is, or might be, untrue or misleading.

Our overarching research question is straightforward: How can an understanding of illegal processes help to reach a more nuanced understanding of how the food supply chain operates. The question is answered by examining the activities of illegal adulteration of meat products by industry insiders. Overall, the synthesis of the literature and the empirical examination of the cases make a contribution to the logistics, criminology, food fraud and food policy literature, as well as providing an interesting example of management theory in alternative, non-traditional business settings. This research pushes the boundaries of supply chain research and practice, demonstrating international relevance in respect of theory and practice whilst contributing by extending supply chain knowledge into the illegal domain.

The article is structured as follows. First an account of the food fraud literature in relation to supply chain theory is presented before providing a brief summary of the Horse and Beef meat market in Europe and the UK. Next, an alternative lens shows how to view supply chains by outlining a theoretical model of the Beef industry from producer to consumer, termed as from ‘farm to fork’ (Dani, 2015). The methodological approach and subsequent data analysis is then presented. An alternative explanation of an unofficial but nevertheless ‘real’ illegal supply chain is presented. The article concludes by discussing the implications of how the understanding of alternative supply chains discussed can enable those charged with crime prevention to restrict offenders in this and other areas.

2. A literature review on food fraud, supply chain theory and Horse-gate.

The focus of this review is the Horse-Meat scandal, involving numerous multi-national companies across Europe and the UK and has led to two inquiries: the Scudamore Inquiry in Scotland and the Elliot Review in England, Wales and Northern Ireland. Both inquiries were critical of the UK and European Union’s investigative apparatus. This is important because illegal meat products entering the mainstream meat market increased after Horsesgaye (Marsden and Morely, 2014; Smith et al, 2015). This review begins with a discussion of food fraud before moving on to consider how it is related to criminal entrepreneurship (Baumol, 1990; Smith, 2009) in the meat and abattoir sectors. Of particular interest are legitimate entrepreneurs who use their insider status to perpetuate
organized criminal food frauds (Lord, Elizando and Spencer, 2014). UK markets (both legal and illegal) are discussed before concluding with a discussion on supply chain issues in the industry. Hitherto, the food industry and in particular abattoir owners have not been subject to serious academic scrutiny in relation to illegal business practices, with the exception of animal cruelty issues. Abattoirs, by their very nature are private areas not generally open to public view and thus evade scrutiny.

**Food Crime and Food Fraud:** Food-fraud is a collective term encompassing the deliberate and intentional substitution, addition, tampering, or misrepresentation of food, food ingredients, or food packaging; or making false or misleading statements about a product for economic gain (see Gallagher and Thomas, 2010; and Spink and Moyer, 2013). Food-fraud is an economically motivated crime carried out intentionally alongside associated actions to avoid detection by regulatory bodies or consumers (Grundy et al. 2012). The profits are comparable to those from cocaine trafficking, but with fewer risks (Smith and McElwee 2015, McElwee, Smith and Lever, 2017). It is a lucrative crime which is unlikely to be detected under normal circumstances. Moreover, the investigation and detection of food-fraud in the UK/Europe is hampered by a variety of inter-linked factors.

There has been an evident increase in illegal criminal activity in the farming and food industries, where food-fraud is now big business (Gallagher and Thomas, 2010:352). The UK food sector is valued at around £103 billion a year to the UK economy (DEfRA 2013:10). The literature on food fraud generally portrays the industry as victims of ‘predatory’ criminal gangs (Lord, et al, 2014). Seldom is the role of industry insiders or rogue-farmers considered (see Smith 2004; and Smith and McElwee, 2013 for a discussion of crimes where industry specific knowledge is needed).

Ostensibly, the meat industry is a continuation of the farming industry and many abattoir owners have experience of farming. There are however, a few reports which provide a sketchy coverage of criminal activity in the meat industry including studies into the activities of businessmen involved in Police operations Aberdeen and Fox (Haslam, Undated). Smith et al (2015) illustrate that during the last two decades in the UK there have been several high profile food-fraud cases, the Halal Meat Scandal (Smith, 2004); the Eurovet Scandal (Smith and Whiting, 2013); and the Black-Fish-Scandal (Smith, 2015).
In all cases the business owners involved were prosecuted using lesser legislative acts than fraud and each investigation, although started by a government agency, was taken over by the police because of their proven investigative ability (Smith et al, 2015). Nevertheless, despite the existence of such high profile cases, little consideration is given to insider knowledge and criminal complicity (Lord et al, 2014).

**Supply chain criminality:** Prior to the last decade criminality in supply chain management research was an under researched phenomenon. However, of late there has been a growth in interest in the topic: Gaonker (2004) on frameworks for determining risks and solutions at a strategic, operational and tactical level; Finch (2004) and Asbjørnslett (2009) on risk management; Smith (2004) and Smith and McElwee (2016) on the supply chain side of the illegal smokies trade; Ogletorpe and Heron (2013) in relation to observable operational and supply chain barriers and constraints; Basu (2014) on the economics of illicit supply chain activity including concealment and corruption; Smith (2015) on the illegal fish supply chain; McElwee, et al (2017) on the illegal halal trade in the UK; Simangunsung et al (2016) on collusion in the supply chain; Manning, et al (2016) on a typology of criminals in the food supply chain; Smith and McElwee (2016) on the theft of tractors for sale abroad; Smith (2017) on the theft of sheep; Gold, Trautrim and Trodd (2015), New (2015), and Stevenson and Cole (2018) in relation to human trafficking; Fox, et al. (2018) on seafood supply chain fraud; and Soon et al (2019) relating to ‘pinch-points’ in the food supply chain. It is if note that these examples of supply chain criminality involve business processes and practices making them of interest to supply chain scholars and practitioners.

A major theme of these studies relates to parallel legal and illegal supply chains and crossover points, or antagonistic gateways between legal and illegal logistics systems from a supply chain perspective causing Finch (2004) to opine that organized theft is a crisis in modern day supply chains. Another emerging theme is that of the increasing complexity and length of supply chains and their exposure to vulnerability and criminal acts within a complex global marketplace (Asbjørnslett, 2009). To handle the unforeseen consequences of this complexity there are two main approaches: (1) design supply chains with built in risk-tolerance and; (2) contain the damage once the undesirable event has occurred.
Nevertheless, both approaches require a clear understanding of the potential for such events to occur as well as the associated consequences and impacts of these events. Moreover, as stated much of the literature treats the business and the supply chain as the victim of outside perpetrators, not as a platform for insider fraud (Lord, et al, 2014). These themes are particularly relevant to the horsemeat scandal. Of course, short supply chains may minimalise the opportunities for fraud with the added benefits of reducing food miles and reducing carbon footprints whilst simultaneously adding value at local and regional levels.

There are numerous business processes and other issues including barriers and constraints which facilitate supply chain criminality. Oglethorpe and Heron (2013) researched the observable operational and supply chain barriers and constraints that occur in local food supply chains in the UK concentrating on smaller producers who seek to increase market penetration across a wider geographic area. They drafted an empirical supply chain map and explanatory narrative which records the burdens and impacts occurring in local food supply chains. This identified seven broad categories of constraint type: constraints due to the nature of the market; due to scale and the nature of products; constraints related to employment and skills; institutional constraints; constraints in supply chain relationships; certification, policy and regulatory constraints; and constraints around personal beliefs and anthropomorphism. It is of note that they did not directly consider criminal intent. Furthermore, Simangunsung et al (2016) argue that the implementation of a joint purchasing mechanism is a key strategy for combating collusion amongst suppliers. Simangunsung et al empirically investigate the effective management strategies for 14 sources of supply chain uncertainty, with an emphasis on uncertainties or strategies that involve ethical issues. They highlight numerous issues, such as evidence of collusion amongst suppliers, to rationing of supplies and increase in prices; unethical influences on government policy; and “abuse” of power by large retailers at the expense of smaller competitors. These issues are germane to most countries. As well as having implications for customers and suppliers these are lessons to be learned by the authorities and fraud investigators.

Academic literature on the Horse-meat scandal.
There is a paucity of academic articles relating specifically to the scandal and those that are in print tend to be descriptive in nature, acting as commentaries, rather than deeper level analyses. One plausible explanation for this is the slowness of the official response and of the investigations into the scandal, combined with the international element and complex nature of the frauds. There is no unifying theme in the academic articles to date. One of the first academic articles was a review of regulations relating to Romania and a commentary on the Romanian government’s efforts to combat food fraud (Stanciu, Dumitrascu, et al, 2013). Premanandh (2013) in reviewing the press and media content in relation to the incidences of food mis-description and adulteration argues that the scandal and the ‘authenticity concerns’ arising from it was a ‘wake-up-call’ to the regulatory authorities. Premanandh highlights the role of the regulatory authorities in circumventing the issues relating to meat authenticity including science based technological solutions to combat fraud and/or accidental mislabeling. Premanandh calls for a greater need for collective action by continuous monitoring schemes; along with improved detection methodologies and stringent regulation on defaulters to minimize or eliminate authentication problems.

In acknowledging the academic and journalistic investigations/lay debates into the scandal, Abbots and Coles (2013) argue that the articulation of food fraud is inherently problematic because the debates surrounding them are invariably labelled as scandals, moral panics and crises; and also because the supply chain systems themselves are unstable. Within the debates, particular types of consumers (typically poor and working class); particular types of producers (Agri-industrial food businesses); and particular types of retailers (“budget” and “corporate” supermarkets) are vilified. Using Horsegate as a case study they unpacked and disentangled these discourses of food and found that “what is wrong with food” is less related to its systems of provision, but more in the ways its various agents are discursively cast and subsequently moralized as perpetrators of a globalized and industrial food system.iv Madichie and Yamoah (2016), argue that the root cause of the scandal is a power asymmetry imbalance in the food supply chain between major suppliers (including supermarkets) and farmers and that imbalance may have contributed to a supplier culture that tolerated the unethical decision making leading to the scandal.
In addition, Ibrahim and Howarth (2015) argue that the vilification of shadowy Eastern European mafia figures resulted from stereotypical notions of otherness. In a subsequent paper, Ibrahim and Howarth (2016) argue that the media framed the 2013 scandal by fusing discourses beyond the politics of food. They identify three recurrent media frames and dominant discourses which converge with wider political debates and cultural stereotypes in circulation in the media around immigration and intertextual discourse on historical food scandals. They find that Horsegate gave rise to affective media debates and frames which invoked fear of the other (horse meat and the supposed mafias who supply it) and the transgression of a sacred British identity, often juxtaposing ‘Britishness’ with a constructed and alien ‘Otherness’.

Empirical data, primarily documentary sources on the scandal, i.e. press and media material were accessed (Scott, 2006), supplemented by a systematic review of academic publications on the scandal. Through a process of immersion (Borkan, 1999; Ellingson, 2009) relevant material was assembled. Immersion as a process permits researchers to submerge themselves in their collected data by experiencing, reading or examining some portion of the data in greater detail. The data was authenticated by writing it up using “Narrative Inquiry” techniques (Clandinin and Huber, 2010; Hunter et al, 2014). From this data, micro-stories of the insider activities of businessmen involved in the scandal were developed. This ‘dual processes’ (Borkan, 1999) emerged over time, framing the synthesis of the individual stories, vignettes and data to make sense of this illegal trade and activity. The meaningful data processed was subsequently articulated a sustainable thesis (Borkan, 1999) against which the working empirical hypothesis - “That the criminal activities of the businessmen involved in the scandal are examples of fraudulent insider criminal activity and not predatory organized criminal activity committed by outsiders” was tested. Additional hypotheses were developed (see below) from the media reporting of the scandal to illustrate the scale of the organized criminal conspiracy, thus evidencing that the scandal was not perpetuated on the industry from outside but from within.

The inquiries were consolidated and organized into a spreadsheet database following the acknowledged investigative processes of collecting, reviewing and collating data by
number allocation. From this database of insider criminals, we created a master file, making connections, uncovering themes across and between stories, articles and other forms of data. Subsequently a process of initiating, diversifying, focusing and refocusing that the ‘seeing of connections’ before reviewing and regrouping the data to make more sense of the stories. These cases or micro-stories (Yin, 2010) provided a narrative order underpinned by a chronology of events and narrated through a continuing story.

4. Documenting the Horse-meat Scandal.

In the UK, the slaughter or sale of horses and horse meat is not illegal provided that it is correctly labelled as such. Although, the horsemeat industry in Europe is a thriving one, in the UK, horsemeat is considered a taboo meat for cultural and historical reasons. The scandal began in late 2012, early 2013 when the Food Safety Authority of Ireland (FSAI) which oversees the implementation of food safety controls in Ireland (set out in Irish and EU laws) conducted a two month long investigation into the authenticity of beef products which culminated in the publication of a report which highlighted the presence of horsemeat in in a frozen burger produced in Ireland (O’Mahony, 2013). This report triggered a pan European food fraud-scandal with regulatory implications relating to how the industry will be regulated in the future. The fraud caught many within the industry unawares because the industry was regarded as being already highly regulated. The issues raised related to the complexity of the food supply chain, traceability issues and the need for DNA based testing within the industry to be more common. The report was highlighted in the press triggering the scandal.

Documentary Sources: The narrative chronology of Horsegate can best be pieced together from the primary documentary evidence (Scott, 2006) from press and media articles because there has been no definitive academic analysis or synthesis of the material relating to the scandal to date. The scandal initiated a continuing debate in the UK Press. The purpose of this section is to document salient points of the scandal, not to provide an in depth and exhaustive account. For more detail, see (Lawrence, 2013) and (Lawrence, et al, 2013). A major aspect of early articles was that of disbelief and shock that such a fraud could be perpetuated (Woods, 2013). A feature of the general tone of the debates
surrounding the scandal were that they were set by the UK and Irish Press focusing upon
the cultural abhorrence against eating horse meat. In other European media outlets the
scandal was initially seen as being a ‘parochial’ one. However, in reality the adulteration
was a global problem (O’Mahony, 2013) which spanned the EU. The scale of the scandal
was quickly uncovered by the efforts of the investigative journalists involved. It
subsequently spread from the UK and Ireland to Norway, Sweden, Finland, Denmark,
Germany, Austria, The Netherlands, Belgium, The Czech Republic, Romania, Poland,
Switzerland, France, Spain, Portugal, Italy, Cyprus and Hong Kong. The ensuing debate
gave rise to various media hypothesis, including:-

- **Media hypothesis 1** – It was an International – Pan European Fraud / Conspiracy
  (Lawrence, 2013).

- **Media hypothesis 2** - ‘Shadowy’, Polish, Eastern European and Italian mafia
gangs were to blame (Doward, 2013; Lichfield, Randall and Sanchez, 2013; Kelly, 2013).

- **Media hypothesis 3** – It was a result of a lack of regulation, deregulation and cuts
  in numbers of inspectors (Hutton, 2012; Taylor and Meikle, 2013; Carrington, 2013).

- **Media hypothesis 4** – That Supermarket chains were complicit by failing to check
  meat suppliers and by imposing unreasonable cost structures for suppliers to fit their
  economic model (Mason, 2013; Bennett, 2013).

- **Media hypothesis 5** – The complexity of the food supply chains were to blame
  (Lawrence, Allen and Scruton, 2013).

- **Media hypothesis 6** – UK customers were complicit themselves by demanding
  cheap ready-made meals (Craven, 2013).

The scandal caused major reputational damage to food companies including European
household names e.g. Burger King, Tesco, ASDA, ALDI, LIDL, IKEA, Co-op, Nestle,
Prima, Picard, Comigel, Silvercrest and Findus (King and Buckley, 2013; Neville, 2013;
Williams, 2013; Neate and Moulds, 2013) leading to huge financial losses. As a
consequence, many consumers lost confidence in their national food supply systems. This
journalistic investigation highlighted the countries and companies involved and the
complexity of the supply chains and the sheer number of companies in the supply chain.v
Each company issued press releases either denying knowledge or an intention to deal with
the resultant PR and financial crisis. None of the major food companies, suppliers nor supermarkets were implicated in wrong doing and the official focus of the inquiries in all countries were on the food processors. A list of suspect companies is presented in table 1:

<table>
<thead>
<tr>
<th>Suspect Companies</th>
<th>Reason for suspicion</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ABP Food Group</strong> Ireland – owned by Larry Goodman and consisting of 4 subsidiaries Silvercrest; Dalepack; Fresh link; and Dairy Crest</td>
<td>Silvercrest was identified as the first source of the scandal. Although no charges were ever brought Tesco dropped them as a supplier and Tesco, COOP, ALDI and Makro dropped Dalepack products. The company blamed rogue managers for buying meat from another Irish trader and sacked them. Silvercrest later went out of business.</td>
</tr>
<tr>
<td><strong>Spanghero</strong> – a French Company. It had a holding company Poujol which bought the meat from Romania.</td>
<td>The French government reported that Spanghero knowingly sold horsemeat mislabeled as beef and falsified documents. The authorities suspended their licence. Links to Comigel and Draap. Arrests were made of 21 people in France in December 2013. In 2019 four accused including Jan Fasan went on trial in Paris in connection with the Spanghero and Comigel cases (see below).</td>
</tr>
<tr>
<td><strong>Comigel</strong> – a French Company. Owner - Erik Lehagre.</td>
<td>Found to be complicit by French authorities and bought contaminated meat from Spanghero. Staff at Comigel were blamed for not noticing anomalies in paper work. Dropped by Findus as suppliers. Links to Spanghero and Draap.</td>
</tr>
<tr>
<td><strong>Draap</strong> – Dutch company owned by Jan Fasan.</td>
<td>Draap is a reversal of the Dutch word Paard which means horse. Fasan had previously been convicted of horsemeat fraud in 2007 and the company is registered in Cyprus.</td>
</tr>
<tr>
<td><strong>Wiljo Import en Export BV</strong> – owned by Willy Selton.</td>
<td>Selton was implicated by the Dutch authorities and was the first accused to be arrested in May 2013.</td>
</tr>
<tr>
<td><strong>Calderdale meats</strong>, Todmorden, Yorkshire, owned by Peter Boddy and managed by David Moss.</td>
<td>The company was named as a supplier of horse meat in the Irish inquiry. Boddy and Moss were arrested on 14.2.2014.</td>
</tr>
<tr>
<td><strong>Farm Box Meats</strong>, Abersytwith, Wales owned by Dafydd Raw-Rees and managed by Patterson.</td>
<td>The company was named as a supplier of horse meat in the Irish inquiry. The pair were arrested on 14.2.2014.</td>
</tr>
<tr>
<td><strong>Andronicos Sideras of Dinos &amp; sons</strong>, City of London and Ulrik Neilsen of Gentofte, Denmark owner of the Danish Company Flexifoods and Alex Beech, manager at the Flexifoods plant in Hull, UK.</td>
<td>The company was named as a supplier of horse meat in the Irish inquiry. Alleged links to Jan Fasen. Andronicos Sideras, 55, was sentenced to four and a half years, while his co-conspirator, 58-year-old Ulrik Nielsen, was jailed for three and a half years</td>
</tr>
</tbody>
</table>

Table 1 – List of Suspect Companies.

Table 1 provides detail of the cases discussed but is not a definitive list of companies nor people involved. Several other cases encountered are not included because prosecutions were discontinued. The press and media coverage continued throughout 2013.
to the present date as investigations unfold. The general tone of the articles was critical of the slow and frustrating progress made by authorities in the individual countries with interdicting the alleged offenders involved in the scandal. Press and media articles relating to the investigations and convictions of the accused are further discussed below as micro-stories.

Official Reports and investigations: The Irish investigation led by Professor Alan Reilly of the FSAI confirmed the presence of horsemeat in the samples tested and asked for an official investigation. The ‘investigation’ by Ireland’s Department of Agriculture, quickly published its findings in March 2013 concluding that there was no evidence that Silvercrest knowingly purchased horsemeat, thereby closing off the Irish investigation.vi

In the UK, a House of Commons Select Committee on Environment, Food and Rural Affairs report expressed concern that horsemeat contamination resulted from fraud and other criminal activity committed across the European Union. It evidenced a complex network of companies trading in and mislabelling beef/beef products which is both fraudulent and illegal. The UK and Scottish Governments also initiated Inquiries into the scandal. In England, Wales and Northern Ireland the Inquiry was led by Professor Chris Elliot and the subsequent report became known as the Elliot Review (Elliot, 2014). Elliott was commissioned by the UK government to conduct an independent review of the UK food supply system to determine what had gone wrong and to suggest measures to make the system much more robust from fraud. Elliott made eight major recommendations to the UK government/food industry about how to deal with the serious issues of criminality in the UK food system. The report detailed a systems approach to food crime prevention particularly in relation to how advances in analytical science can help combat food fraud. In Scotland a separate inquiry by Lord Scudamore produced similar findings (Scudamore, 2015). Both Inquiries highlighted that the scandal was a food fraud perpetrated from within the industry and resulted in changes to their respective Food Standards Agencies Investigative structures and procedures.

5. Findings / Results.
The gap or lacuna in the literature on criminality in the food supply chain is driven by the binary assumption relating to the belief that criminality within the food supply chain is perpetuated by predatory criminals operating from outside the supply chain (Lord et al., 2014) when in reality it is only logical to consider that in some instances, insider involvement may be in play. Thus, the literature appears to support the assumption of the outsider thesis. Consequentially, one must always consider the possibility of the insider/outsider dichotomy holistically. Additionally, the extant literature on food fraud appears to implicitly consider supply chain criminality and risk management from an insider perspective. However, the emerging literature on supply chain criminality and risk management is beginning to challenge this position by considering the involvement of predatory industry insiders. Moreover, the media hypothesis discussed above also appear to support the outsider thesis as argued below. For example, media hypothesis 1 that the horsemeat scandal was an international Pan European Food Conspiracy when taken into consideration along with media hypothesis 2 relating to the involvement of shadowy Mafia figures also supports the thesis by lending credence to it. This position overshadowed media hypothesis 3, 4 and 6 relating to the lack of regulation and the complicity of super market chains. Also Media hypothesis 5 relating to the complexity of the frauds appeared to serve the purpose of excusing the authorities from any blame. It is surely of note that the media hypothesis formulated did not even consider the possibility of insider involvement in the crimes. From an analysis of the documentary evidence it becomes evident that the rhetoric used by the media and authorities and in particular the focus on ‘rotten apple’ thesis and on rogue managers and rogue traders dilutes the presence of the insider criminal from the equation. It took an extended period of time from 2013 to 2019 (6 years) in which time patient investigation tested in the criminal justice system and a more in-depth investigative journalism process to uncover the insider involvement and thus highlight the theoretical importance of consider the insider / outsider dichotomy in full. Defense claims of poor management - not criminality also served to obfuscate the matter.

One of the main findings relate to the complexity of the meat supply chain and the number of countries, agencies and stakeholders involved. From the analysis we identified numerous stakeholders who play a part in the process. See figure 1 for a visual representation:-
We identify two basic supply chain types – localised and extended. Figure 2, models and illustrates the fraud, demonstrating the complexity of the horsemeat supply chain. The figure illustrates the layered complexities of extended supply chains involving other EU and non-EU countries taking into cognisance the different types of dealers and individuals involved and also factors in the aspects of illicit, illegal and criminal involvement in the trade. It is not an exhaustive diagram because it does not factor in the different political, legal, legislative nor local differences in institutions and structures involved. There will always be players involved of whom little is known so the models built can only be tentative. For example, before ‘Horsegate’ the authorities and the public did not suspect that the meat supply chain was being adulterated with horse meat.

Presenting the case stories.

This section narrates the micro-stories of those investigated as a result of the scandal and discusses the nuances of the cases analysed before reporting on the findings. Table 2, presents the individual micro-stories, chronologically as the prosecutions occurred illustrating the linkages to associated companies and sentences imposed.

a new fraud where his gang stole domestic and sick horses across Europe (Belgium, Italy, Romania, The Netherlands, France and Spain) and passed them off as farmed horses. Seventy five people were arrested across Spain and charged with fraud, theft, forgery, criminal organization and money laundering. At the time of writing he is facing prosecution for his involvement in the Spanghero and Comigel cases.

details are private.

**Spanghero** – French Company.

The French government reported that Spanghero knowingly sold horsemeat mislabelled as beef and falsified documents. The authorities suspended their licence. Links to Comigel and Draap. Arrests were made of 21 people in France in December 2013 and in 2019 Jan Fasan and three other co-accused from Spanghero went on trial. Four accused were found guilty in 2019 – Jacques Poujol the owner; his manager Patrice Monguillon, Jan Fasan and his business partner Hendricus Windmeijer. Poujol was sentenced to two years in jail and had his home and 100,000 euros confiscated; and the Spanghero manager Patrice Monguillon received a 1 year suspended sentence. Jan Fasan received a 2 year sentence and his manager Hendricus Windmeijer was also given a 1 year suspended sentence.

**Comigel** – French Company. Owner - Erik Lehagre.

Found to be complicit by French authorities and bought contaminated meat from Spanghero. Staff at Comigel were blamed for not noticing anomalies in paperwork. See narrative above in relation to Spanghero who were held to have supplied Comigel with the meat. Case still underinvestigation.

**Calderdale Meats,** Todmorden, Yorkshire owned by Peter Boddy and managed by David Moss.

Boddy and Moss were arrested on 14.2.2014 in a joint operation between the FSA and police. Moss admitted falsifying invoices / paperwork. Both blamed the shambolic record keeping which meant that the sources and destinations of horses could not be proven. Boddy pled guilty to failing to abide by EU Meat traceability rules over 17 horses and of failing to keep records of sales of 50 horses. Moss admitted forging invoices regarding the sale of horsemeat. Boddy was fined £8000. Moss received a suspended 4 month prison sentence. They were ordered to pay £10,000 legal costs.

**Farm Box Meats,** Abersytwith, Wales, owned by Dafydd Raw-Rees and

Raw-Rees and Patterson were arrested on 14.2.2014 in a joint operation between the FSA and police. Investigators found goat meat falsely labelled Patterson pled guilty to 17 counts of falsely mislabeling goat as
managed by Colin Patterson.xiii as lamb. Information received that the firm were supplying horsemeat could not be proven and the two accused were not charged with horsemeat offences. The pair initially denied the offences and used neutralisation tactics to avoid criminal blame. Raw-Rees claimed to be a silent partner with little daily contact with the business, whilst Patterson denied knowing the difference between goat and sheep carcasses. Patterson also blamed his poor bookkeeping abilities and the lack of an adequate recording system. The company’s books were described by prosecutors as being a ‘shambles’. The duo had multiple Directorships of several other companies many of which went into liquidation. This could be an evasion tactic. The company went into administration with losses of over £1 million. It is not known if the directors have started up in the business again.

| Andronicos Sideras | Sideras who has links to Cyprus was accused of a fraud / conspiracy in 2012 by passing off horsemeat as beef. Large shipments of poor quality ‘trim’ passed legally through various companies before being criminally adulterated to pass off as genuine beef. The prosecution proved a tissue of lies and deception motivated by greed. Falsified paperwork created a false provenance for the adulterated meat. During searches of Flexifoods premises in Denmark and the UK emails and documents proving the conspiracy to defraud were located which detailed how the paperwork was falsified. Sideras was found to have also created false paperwork and falsified health certificates, destroying emails to cover the deception. His fingerprints were found on falsified labels. Sideras pled not guilty claiming he was only storing the meat for Flexifoods and that the mislabeling was a genuine mistake after pallets of food were damaged in transit. This evidences the use of neutralization tactics. The official cost of the fraud was cited as £177,869 but it is estimated that it may have netted over a million £’s. |
| director of Dinos & sons, City of London. Ulrik Neilsen | Neilsen and Beech pled guilty. Neilsen was convicted of one charge of conspiracy to defraud and sentenced to 3½ years. Beech received a short suspended sentence. Sideras pled not guilty but was convicted of one charge of conspiracy to defraud and sentenced to 4 and a half years imprisonment. |
| of Gentofte, Denmark owner of the Danish Company Flexifoods and Alex Beech, manager at the Flexifoods plant in Hull, UK.xiv |

Table 2 - The individual micro-stories with case details.

Understanding the scripted anatomy of the scandal.

In addition, the press coverage led to a number of identifiable outcomes which we argue result from a scripted ‘Amplification Spiral’ (Cohen, 1972). Firstly, journalists express outrage and start a moral panic before moving on to other stories. Secondly, politicians get...
exposure and sound bites and vilify the perpetrators as shadowy criminals (not shady business figures), or the more astute commentators, for example in Ireland and Poland acknowledge flaws but distance their country from the scandal. As a result, ouraged customers boycott products or supermarkets temporarily and take to social media. They quickly return to their original shopping habits. To counteract financial and reputational damage the supermarkets engage in damage limitation and issue apologies and denials of knowledge. They remove the product from the shelves or ban it whilst dropping the supplier from their lists and publically issue press releases citing financial and reputational damage and portraying themselves as victims. Most survive the scandal. Simultaneously, supply chain companies go into denial mode and issue disclaimers relating to practices or the more disreputable outright deny it until it blows over. If the scandal does not abate, the investigating authorities investigate invariably proceeding at a slow pace. Statistically, few court cases result. Whilst this script is unravelling the accused hide behind claims of bad record keeping, or claim to be poor businessmen. They blame a manager or themselves for not managing the business properly, claim mistakes and errors to distance themselves from blame or may cite personal or health issues for their lapse. International Investigations take years to complete and there is a high attrition rate. There are simply too many agencies involved with staff who possess different levels of investigatory skills. Few accused ever reach the courts and traditionally even less are convicted. Those that are usually receive low monetary fines, albeit this research has revealed that the thorough horsemeat investigations’ and trials are reversing this trend with jail sentences being issued and higher monetary fines imposed. Journalists repeatedly revisit the scandal to report on developments. Moreover, it is apparent that supermarkets and multi-national corporations use public relations techniques to survive scandals whilst genuine businessmen, caught up in scandals, may suffer reputational and financial loss. Many resign from the board and bankruptcy and ruination may follow on from an entrepreneurial exit (Smith and McElwee, 2011). Conversely, ‘Dodgy Businessmen’ simply change the company name and register new directors conducting business as usual with a new trade name. This enables them to continue trading unabated whilst Mafia and organized crime remain scapegoats.

It is evident that “Horsegate” was an international – Pan European Fraud thus proving media hypothesis 1. An analysis of the empirical material above reveals that far from being
a mafia inspired fraud it is organized criminal activity committed by businessmen and industry insiders (Lord et al, 2014). However, just because there is no evidence, we cannot discount the possibility. It also disproves media hypothesis 2. A lack of regulation, deregulation and cuts exacerbated the scandal proving media hypothesis 3. There is no evidence to substantiate media hypothesis 4 that the supermarkets were complicit, nor media hypothesis 6 that the UK customers were complicit. This points to an imbalance and power asymmetry between small and major companies as suggested by Madachie and Yamoah (2016). The stories evidence the complexity of the extended food supply chains. In all cases greed in the pursuit of profit was cited as the main feature of the prosecutions. The price differential between the low cost of horsemeat and the high cost of beef made the adulteration lucrative and ensured that those involved could compete better against more honest competitors. What can also be seen is that the financial costs of being successfully prosecuted to the defendants are comparatively very low. In all the cases the burden of proof in terms of the acts being fraudulent were met in that the accused all knowingly and dishonestly made a false representation to gain benefit for selves and others thus proving the empirical hypothesis “That the criminal activities of the businessmen involved in the scandal are examples of fraudulent insider criminal activity and not predatory organized criminal activity committed by outsiders”. Indeed, the frauds were committed within the meat industry by ostensibly otherwise trusted businessmen and with the exception of Fasan none of the individuals appear to have been on police, customs nor FSA databases. This makes detection difficult and points to a need for a more integrated approach to intelligence gathering in relation to business crime, particularly by insiders. It is also of significance that the crimes were committed through and facilitated by entrepreneurial business practices in the supply chain in contrast to extant supply chain theory and literature which normally treats crime as an exogenous event (Lord et al, 2014). This needs to change to reflect the presence of insider criminals.

We argue that the term ‘scandal’ is over-used to describe and excuse criminal greed and poor management practices that pervade the food industry. Short-term outrage is often forgotten as the headlines move on. Journalists and academics ‘document’ it but move on to other stories. As the scandal unfolds it triggers the well-rehearsed actions of those involved and this initiates well scripted performance which must be challenged or accepted
by those involved. This iterative process sets up a socially constructed and enacted ‘Amplification Spiral’. However, it is more than a ‘scandal’ because it is an endemic aspect of criminal supply chain practice and also of the inevitable aspect of entrepreneurial cognition and behaviour whereby if there is money to be made then there will be a taker. The above analysis and discussion also addresses the overarching research question – “How can value chains be utilised to include illegal processes and develop a more nuanced understanding of illegal enterprise? It does so by considering illegal value streams and parallel illegal supply chain practices. Our main finding and takeaway message is that there is a need for a change in the way supply chain criminality is regarded and to challenge this by acknowledging the reality of supply chain criminality and malpractices. Our continuing academic interest lies is in moving beyond documenting practices to better understand the business processes and practices involved.

From an operational supply chain perspective a deeper analysis of the synopsis, micro stories and the anecdotal evidence provided led us to articulate the following observations. All the micro-stories discussed above involve a moral as well as a legal element in that they involve the deliberate use of deception by lying and cheating (Green, 2006) across the supply chain at different nodal points and legal jurisdictions. Thus whilst much of the illegal horsemeat products used in the adulteration may have originated in Romania or other European countries the frauds were only made possible by the collusion or connivance of criminal businessmen and the lax nature of legal procedures adopted by otherwise legal food processing businesses. This inevitably entailed the falsification of documentation and the collusion of owners and managers within otherwise respected processing businesses. At present no single Food Standards body or authority could have interceded at an earlier stage in the supply chain at each individual nodal point to stop the fraud. Only the inception of a European wide organisation adopting a multi-agency approach could achieve interdictions at an earlier stage of the process. Also, in all the scenarios the legal approach has always been retrospective and there is a pressing need for a more proactive approach to tackling the food fraud epidemic. An intelligence led proactive strategy is clearly required. The analysis and discussion above makes a contribution to the Operational Supply Chain management literature by considering illegal processes and the moral as well as illegal elements of food fraud and by the inclusion of a conceptual model which leads
to the further hypothesis that insider involvement is usually necessary for such a widespread fraud to be perpetuated.

Finally, in relation to the development of a theory of insider involvement in supply chain criminality the fact that such a factor was not even considered by the media and initially by the authorities mitigated against the development of a credible explanation – thus even adopting Whetton’s (1989) framework of What and How could not have led to linking insider involvement to the crimes and in fact prevented the development of a credible and logical assumption from which the Why element could be addressed i.e. that one could build logical, credible and compelling arguments to fully explain the nature of the crimes. Had insider involvement been considered it is inevitable that insider involvement must have been present at the outset of the scandal. The fact that insider involvement was not considered prevented us from addressing Whetton’s fourth element of Who, Where, and When – the contextual factors from being properly assessed at the time. It took patient investigation to understand the context that to commit the frauds one had to have insider knowledge. This allowed a full theoretical explanation to evolve over time. From a theory building perspective the new contextual evidence allows us to address the three pillars of Whetton’s theory development process by elucidating what is new and addressing the so what and why so questions. The involvement of insiders provides a powerful theoretical explanation.

6. Conclusions.

This study demonstrates international relevance and its global impact (Both theoretically and practically) whilst narrating a compelling story that will enable investigators to better understand illegal enterprise and food fraud from a supply chain perspective and more adequately address the concerns stated in the UK Fraud Act, 2006. This study extends supply chain knowledge beyond the usual dyadic perspective. The results demonstrate that illegal supply chain practices are a multi-faceted concept that requires an understanding of media driven scandals, scandal-scripts, as well as business practices and processes alongside a multi-agency approach to enterprise orientated crime. This study thus demonstrates how contemporary Supply Chain practices must be integrated
in nature and responsive to contemporary information driven issues and at the same time be proactive. Our approach suggests that supply chains can be analysed in order to understand illegal processes in addition to conventional legal processes. We illustrate examples of criminal-entrepreneurship which although productive and profitable for the criminal entrepreneurs exploiting food supply chains is nevertheless unproductive and potentially destructive to society in a Baumolian sense.\textsuperscript{xv} We make an incremental contribution to theory (see Eisenhardt, 1991 and Eisenhardt and Graebner, 2007) by analysing, reflecting and theorising on the narratives of supply chain criminals and by challenging and extending existing knowledge (Whetton, 1987: Eisenhardt and Graebner, 2007) and by building a descriptive explanatory model. We establish a contribution by virtue of the novelty and originality of our topic grounded in extant supply chain literature and because it extends upon accepted knowledge by including and recognising the importance of scandal scripts. Our work fills a gap in the extant literature by addressing an obvious lacuna in the literature in terms of both incompleteness and inadequacy (Locke and Golden-Biddle, 1997). In particular we contribute to an emergent theory of supply chain criminality by providing documentary evidence of it existance.

We argue that one must work from the presumption that there will inevitably be illegal process involved in the food supply chain. It is only by understanding such illegal processes that work towards interdicting and excluding such illegal processes can be made. This work will be useful to European food standards agencies in that it furthers our understanding of entrepreneurial practice and morality in the food industry. Overall it helps to better understand the criminal entrepreneurial practices involved and how they are linked to business models. Business model frameworks can be adapted on a case-by-case basis depending on the type of fraud committed by different criminal actors, which can in turn be used as an investigative tool by the various agencies involved. These models can be used to help detect and potentially disrupt the criminal enterprises. The applied model synthesises practical knowledge thus facilitating the transfer of knowledge process between academia, the food industry and the investigative and regulatory agencies involved. It helps us collapse differential boundaries to knowledge sharing by mapping and authoring a shared knowledge base and lexicon, whilst also disseminating the transformative knowledge to the academic and practitioner communities. This study begins
the process of developing a theoretically informed conceptual ‘business model’ for understanding food-fraud whilst synthesising academic and practical knowledge.

From an academic perspective there are obvious implications. Firstly, there is still a dearth of academic research and there are few policy-related studies into the pernicious issue of food fraud. It may take fatal consequences for it to be given more serious consideration. Secondly, there is the difficulty in obtaining data because of access to such enterprises and entrepreneurs. Moreover, academics are still reliant on documentary sources of evidence and on journalistic investigative reporting and there are obvious legal implications of overstepping the boundaries of reporting the truth.

There are distinct policy implications from this work, in particular the need to legislate not only against international criminal conspiracies, but also the everyday ordinary organized food frauds perpetuated. Low penalties do little to prevent such crimes which need to be taken more seriously by the authorities, and in some instances treated as major crime. Moreover, in formulating food laws, rules and regulations, greater cognizance should be taken to consider how supply chains in the food industry could be better protected from predatory criminal actions. There are also practical implications and outputs, in particular our adaption and development of an investigative framework based to cover illegal business models.

What the research has shown is that the criminal activities of ostensibly legitimate business owners impact seriously on the industry but because they operate in a legitimate entrepreneurial arena can slip between the intelligence agencies and the police intelligence gathering apparatus. On this account there is a need for a greater intelligence gathering exercise to combat food fraud, whilst initiating greater and more coordinated multi-agency training in investigating organized food fraud. It is clear that the cases discussed constitute continuing criminal and entrepreneurial ventures committed by a small but significant number of criminals operating to illegally circumvent the legitimate supply chain and thus increase their profits. This makes it of interest to supply chain scholars and food industry practitioners. The repeated criminal acts of such industry insiders constitute a continuing conspiracy.

End Notes.

Including: Andronicos Sideras, Ulrike Neilsen, Alex Beech, Peter Boddy, David Moss, Dafydd Raw-Rees, Colin Patterson, Willy Selton, and Jan Fasen.

The findings of both inquiries call into question whether the UK’s response is fit for purpose and whether a new investigative model is needed based on the Danish Food Standards Agency or the Dutch NVWA.

Operations Aberdeen and Fox related to wholesale adulterations of food products by factory owners who added condemned meat into the supply chain to maximize profits. The Eurovet scandal related to a businessman importing illegal veterinary items from the EU and selling them to UK farmers without the necessary approval.

This fits well with moralizing tone of the press and media debates in relation to hypotheses 2, 4 and 5.
