

Women's motivation to lead in small social enterprises: A systematic literature review

Abstract

Purpose: This paper explores the motivation of women to lead in small and micro non-profit organisations in the United Kingdom.

Methodology: A systematic literature review within a fixed timespan and geographical boundaries was conducted around key themes and semantic criteria.

Findings: Evidence of gender differences related to the motivation to lead in the non-profit sector was revealed. The review indicated that men were driven by pragmatic interests and ego; whereas women were motivated through the opportunity to be change agents.

Research Limitations: Findings and implications are limited in scope by the geographical focus and the exclusion of 'grey literature' from the study, as well as the nature of secondary research.

Implications: This study provides exposes a gap in the field and new insight into the motivation to lead and indications for diversifying executive positions.

Introduction

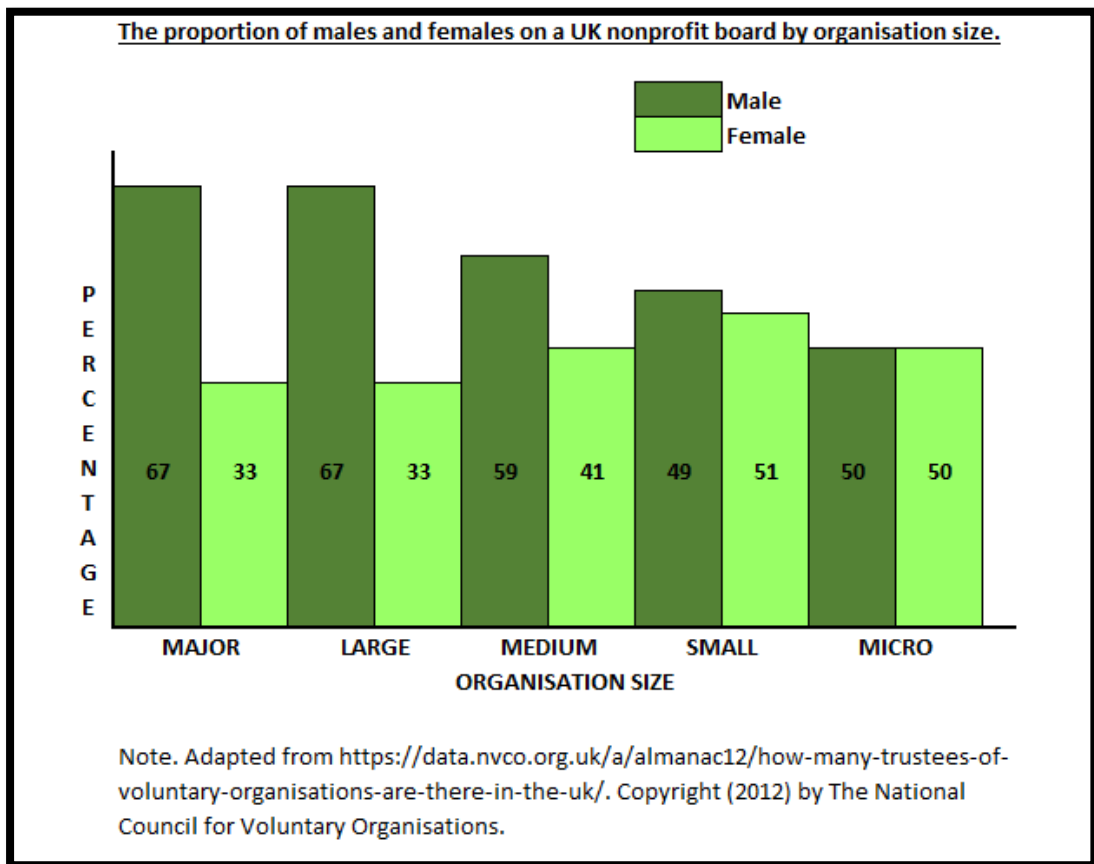

Social justice in terms of gender inequality in the workforce and in leadership remain the subject of heated debate both academically and in practice. In particular, the #metoo movement, recent waves of sexual misconduct cases, and new legislation in the UK regarding the gender pay gap have heightened public awareness. Despite advances in women's status both in society and in the workforce, the limited number of women in executive leadership positions in most business sectors continues to drive research in the field of gender differences in organisational leadership. Despite women being in the majority in the UK representing 50.7% of the population (The World Bank, 2017), inequality continues to proliferate. Indeed, women are not only widely underrepresented in leadership positions in the for-profit sector, women also continue to be underrepresented in leadership in segments and sectors in which they represent a large majority of the workforce.

The not-for-profit sector is an example, as the charity industry in the UK has a wider variety of employees and a higher ratio of female employees than the private sector. Moreover, the volunteer sector in UK may be experiencing a resurgence. Employers in the for-profit sector have recognized a public interest in community engagement as evidenced by increasing numbers of firms offering volunteering opportunities to employees (NVCO, 2018). In 2016 a total of 2.7% of the workforce in the UK was classed as working within the voluntary sector (NVCO, 2017). The volunteer workforce is comprised to 65% of women, in comparison to 40% of the private sector workforce (NCVO, 2017). Some 39% of volunteers are over the age of 50, significantly higher than 29% in the private sector (NVCO, 2017). Charity workers are also well-educated, with some 49% of all volunteers holding a University degree, in comparison to the private sector in which 29% hold a University degree. Indeed, the non-profit sector draws a significant number of female volunteers; 1.76% of the total UK workforce are women working in the non-profit sector (NVCO, 2017).

The voluntary sector provides considerable economic value to the UK. In 2012 the sector contributed £11.7bn to the Gross Value Added of the UK, accounting for 0.8% of the total UK GVA; volunteers also contributed £23.1bn in estimated value of their output (NVCO). Comparatively, the volunteer sector sees a fairly large number, 39% according to NVCO (2012) of women in leadership positions. A closer look at the leadership of not-for-profit enterprises shows that 14% of charity boards are all female, in comparison with 17% of boards that are all male (NVCO, 2012). The gender composition of non-profit boards shows a clear correlation to the size of the enterprise (see Fig. 1). The larger the size of the charity in UK, the higher the number of male board members, a trend that extends to other industrialized nation such as the US and France (see for example Lee, 2014; Prouteau & Tabariés, 2010) . When looking more specifically at the type of charity/non-profit organization, men outnumber women in leadership roles across nearly all the sectors in UK, the only exception being Parent Teacher Associations and Playgroups & Nurseries (NVCO, 2012). As such, the volunteer sector provides an interesting context for examining gender differences in attaining leadership positions.

Whilst volunteering makes a valuable contribution to the economy in the UK as well as to others' lives, the charity/volunteering/non-profit sector is not immune to scandal. Recent reports have recounted a number of accusations of unethical behaviour levied at high profile charity and volunteering enterprises resulting in investigations and, in some cases, the resignation of CEOs and high-profile leaders. The motivation of leaders in these economically and socially valuable organizations may be of interest to the field of leadership considering the not only scope and nature of their impact, but also the unique context of voluntary service in terms of individual valence, instrumentality, and gender.

Figure 1 Gender composition of UK non-profit boards

Motivation is influenced by a number of factors, whether cognitive or affective (Elprana et al., 2015). Motivation can also have an ethical component. Borgerson (2007) theorised that selflessness and the care of others is generally viewed as a traditionally female trait, and the ethic of care has been predominantly understood as a feminine ethic (Reynolds, 2016). Therefore, it could be thought that volunteering and working in the non-profit sector could be essentialized as feminine motivation. From a social role theory perspective (Eagly & Wood, 2012) it can be argued that culture and socialization influence the desire to volunteer and lead within the non-profit sector. On the one hand, in many communities 'doing good works' (Lee, 2014) is considered a fundamental of community belonging and can raise the status of the individual. Motivation to volunteer may be wholly pragmatic, for example, taking up voluntary work can improve skill sets and increase employability.

Burggreave (2015) theorised that human beings constantly strive for a meaning for our existence, that volunteering and ‘giving something back’ provide meaning to our lives.

Taking into account the unique context of the voluntary workforce, its gender composition, gendered assumptions of social roles and motivation as well as leadership, this paper explores the motivation to lead in the female workforce of the non-profit sector in the UK. Whereas, in the large non-profits where remuneration packages can be very competitive, in small and micro non-profit organisations specifically very little in the way of financial reward is available. These organisations are often seen as the ‘grass roots’ organisations that struggle for funding and fight for their survival. This study focusses, therefore, specifically on micro and small enterprises, and examines factors driving or encouraging women to undertake leadership roles or responsibilities in a systematic literature review. Implications for recruitment and leadership development are considered with the aim to inform third sector, public and private sector considerations for diversifying the gender composition of leadership roles.

Methodology

The use of a literature review is a common tool within the research community. The use of available literature allows the researcher to critically analyse and review the current knowledge within their chosen subject (Matthews & Ross, 2010). This aids the researcher as they are able to identify areas that are under explored and expose gaps in the current thinking/research (Matthews & Ross, 2010). The use of the systematic literature review is a relatively new phenomenon in the field of management and business research (Jesson et al., 2011) and allows for a rigorous, systematic and comprehensive review of the literature available through the use of specific criteria (Booth et al., 2016). Tranfield et al. (2003) noted that this form of literature review allows the researcher to both map and assess the

information available in a robust and transparent process that allows for a conceptual discussion of the research issue. In order for the systematic process to be successful the management research questions need to be clearly defined and specified. This is due to the divergent nature of the management research culture (Tranfield et al., 2003) which is more concerned with the context of the problem and why it does or doesn't work, than experimentation as to what works. Baumeister and Leary (1997) recommend that a literature review asks more questions than it answers and allows the gap in interpretation to be bridged, allowing problems and issues to be identified and further explored.

Papaioannou et al. (2009) note that although a systematic literature review allows for a thorough and sensitive exploration of the literature available they are hugely time consuming and benefit from more than one researcher being part of the task; this allows for a more objective search to be undertaken. This sentiment is echoed by Tranfield et al. (2003) who also believes that a multi-researcher approach allows for a more effective and scientific literature search to be achieved. Baumeister and Leary (1997) additionally believe that a systematic literature review should not include hypotheses at the start as this loses the researcher the opportunity to 'capitalise on chance' and expand or adjust the hypotheses to reflect gaps in the subject research.

For the purpose of this systematic literature review the starting point was the studies of Lee (2014) and Prouteau and Tabariés (2010) who explored women and voluntary organisations. The prevailing gap in extant literature provided a guide for identifying keywords and themes to be explored and producing a mind map to assist in the generation of pertinent key words for the literature search parameters (see Appendix 1). Using the LIBRARY search interface available at A UK UNIVERSITY, the defined search parameters were applied in a variety of databases. The initial keyword search for peer reviewed journal articles yielded 2840 results (see Appendix 2); the application of timespan filters 01/01/2000 –

01/06/2018 and category specifications reduced the pool down to 195 papers. This procedure allowed for an expansive search of the data but also accounted for the effects of social change and the view of women within business since the noughties. The application of category exclusion (see Appendix 3) at this stage reduced the article pool to a more manageable size. Categories were excluded if they were deemed less relevant to the business context or focused on areas outside of business-related subject matter or personal values. For example, corporate social responsibility and general social responsibility were excluded as although these activities as values may have influenced motivation they are more appropriate in the context of larger corporations, not necessarily the small and micro organisations as was the focus of this review. The category of religion was excluded due to the divisiveness of the subject matter and its openness to interpretation. At this stage, two articles were included that emerged outside the search criteria; these were Babchuck (1960) and Jarboe (2012). Babchuck (1960) provided historical scope for the issue being explored, and thus, offered a starting point to indicate the changes that have occurred in society since this subject came into the scope of research. Jarboe (2012) is classified as 'grey literature', however, the report provided interesting qualitative information in regard to women, charity and volunteers, which provided valuable and pertinent information to this literature review.

The abstracts of the 195 remaining were read and evaluated according to further selection criteria specifically geographic area preferring the UK, inclusion or focus on women, and relevance to the context of the review. Articles that focused on geographical areas outside of the Euro zone were excluded at this point, studies from the USA and wider world were not included as these geographical areas have different definitions for non-profit and charity businesses and there are already a large number of studies available which look at women and volunteering in these areas. Studies that looked from a solely male perspective were also excluded as they did not offer any new insights into the motivation of women to

volunteer. Studies which were trying to provide frameworks to measure motivation and create very specific results were read more fully (abstract and conclusion) and excluded if their conclusion did not yield results that were relevant to the research question. At this point there were 85 articles left to read fully. A further 29 articles were excluded at this stage, as upon reading, they were found to be outside the scope of the review, were not relevant to the review, offered very specific limited results in their findings which were not applicable to the small and micro non-profit enterprise, or were repetitive of previously read studies, and offered no new insights. The remaining 56 articles that were included in the literature review came from a variety of journals and were held within several databases (see Appendix 4). These articles offered the widest range of perspectives, findings, and conclusions and served to identify gaps in the literature which in turn opened up potential for hypothesis creation and further study. A list of the authors and article titles are available in Appendix 5. The articles not included in the literature review are listed in full in Appendix 6; these articles, although valid, corroborated and supported the literature used and although were relevant to the subject matter, did not offer further valid insight into the scope of this review. As such, a total of 36 articles contributed to the present systematic literature review.

Discussion of the Literature

Although a considerable amount of research is available examining the motivations for engaging in volunteer work, few studies explore the reasons behind the motivation to lead in volunteer settings, and, in particular, that focus on women. This paucity of research prevails despite the fact that women actively lead and represent the majority of leaders within small and micro enterprises. These enterprises are sometimes thought of as ‘grass root’ organisations. Leadership positions in such small and micro enterprises rarely come with any form of remuneration, though they carry the same amount (proportionally) of responsibility

and stress as any other leadership role. In this systematic literature review several pertinent areas will be explored, these influence the sector and the women that work and lead within it. The areas to be reviewed include motivation, incorporating types of motivation and reasoning and leadership, including styles and gender influences as well as other gender specific considerations. These together with ethical concerns and the issues with working and leading within the charity/volunteer sector will combine in producing a wide-ranging view of female motivation and the 'reasons' why the voluntary sector is considered the 'female sector' (Cregan, 2002) within the research currently available.

Charities and the volunteer sector as a whole face a difficult existence. There is a near constant struggle to recruit and retain volunteers to work, fundraise and provide administrative support and leadership (Charity people, Charity leaders and Career volunteers, 2016). For the purpose of this literature review the umbrella of charity and volunteering were used as the foundation for volunteering leadership; this is due to the limited number of peer reviewed articles available. O'Brien et al. (2010) notes that it is one of the most difficult but most important tasks of any charity; as they put it to have 'the ability to encourage, empower and retain volunteers'. This coupled with the need to raise much needed funding mean that the leaders of these organisations face a difficult struggle. As noted at the start of this literature review, the non-profit / voluntary sector (3rd sector) makes a significant contribution to the UK economy (NVCO, 2012) and the leaders of these enterprises are responsible for their overarching vision and operation. O'Brien et al. (2010) remarks that the UK Government views volunteering as a way of building sustained civic involvement and assists in realising 'community' policies and is therefore vital to both society and to the economy. Jarboe (2012) observes in the 2012 Women Count report, that diversity is necessary within the volunteer community and can be thought of as the key to the legitimacy and success of

leadership roles within the sector, without this diversity the pool of knowledge and life experiences can become stagnated.

As early as 1960 studies were being undertaken which explored the reasons that charities received volunteers, Babchuck et al (1960) noted that different types of organisations provided different types of ‘gratification’ to volunteers and that women tended to work more in ‘expressive organisations’ which gave near instant gratification. This hypothesis was further explored by O’Brien et al. (2010) in the context of health and well-being benefits associated with volunteering. They termed this ‘experiential’ volunteering and as an approach that charities continue to work towards in the pursuit of new recruits. Alfes et al. (2015) expand the notion of gratification and empowerment theorised by Babchuck et al. (1960) and O’Brien et al. (2010) by hypothesising that volunteer engagement creates a positive psychological state, and this engagement is the important challenge in the retainment of volunteers. Alfes et al. (2015) appear to have synergy with this hypothesis by further theorising that engagement reduces the psychological costs of the demanding work and conditions. It encourages personal growth and allows for feelings of pride and respect to flourish. Lanfranchi and Nancy (2015) reiterate these concepts by noting that volunteers are attracted by what they term “socially desirable” activities rather than monetary reward. This extrinsic factor along with more family friendly practices is considered by Lanfranchi and Nancy (2015) as the reason that more women than men are working in the voluntary sector.

Lanfranchi and Nancy (2015) continue to speculate that the reputation of the business and their interest in the cause that it represents are further motivational factors that are faced by the charity in attracting volunteers let alone leaders – a struggle which can be greater for the smaller less well-known enterprises. Parsons and Broadbridge (2006) appear to corroborate this as they believed that interpersonal relationships played a major factor in the recruitment of volunteers to an organisation. This coupled with a sense of achievement

ensured that volunteers became loyal to the enterprise and would be willing to undertake leadership roles. All of these observations appear to have been confirmed by Garcia-Cano et al. (2016) who summarised in an encompassing idea that there are six motivational factors to volunteering these are; Values or an altruistic desire to help others; Understanding, the possibility of learning and practising skills; Social, the ability to create social bonds and / or being viewed favourably from significant others; Career, the professional benefits of volunteering; Protective, a defence mechanism for self-image and finally Enhancement, the chance for personal growth and the associated positive effects of the giving of self. It is within these factors that the desire to lead is fostered, and additionally potentially provides the foundation to motivate others to lead also.

Therefore, it is clear to see that from the beginning with the recruitment and retention of volunteers that the reputation of the charity and the gratification of 'giving back' are important factors; this is congruent with the findings of Prouteau and Tabariés (2010), who found that the type and prestige of the enterprise affected the number of volunteers. Using this information, an exploration will now be made as to how the gender of individual can influence their motivation to lead.

Prouteau and Tabariés (2010) noted that the gender of the individual in the leadership position was influenced by a number of factors, including the age, international status and 'prestige' of the enterprise. As we noted in the previous section this 'prestige' or reputation also influences the recruitment and retention of volunteers. When looking specifically at the age and type of enterprise Prouteau and Tabariés, discovered that the older and more established the charity and those with International branches were less likely to have women on their Boards or in leadership positions, this is reflected in the UK by the findings of the NVCO (2017) as illustrated in Figure 1. Baxter (2017) speculated that this was due to female leaders not conforming to the engendered expectations of these 'traditional' workplaces.

This speculation appears to be supported by Andreassen et al. (2014) who noted that cultural bias increases as the enterprise becomes more 'formal' as it grows and begins to conform to cultural norms and beliefs. Baxter (2017) continues that female leadership traits are not as 'robust' in business as 'male' or normative practices. These include a tough, direct or 'no-nonsense' leadership approach. Though this may be seen as the 'norm' this leadership style can filter down through the 'ranks' and there have been a number of high-profile cases where large international charities have been accused of bullying and 'underhand' fundraising tactics; with fundraisers targeting older and vulnerable people to extract the most money possible. This behaviour could be seen to be coming 'directly from the top' and could be seen as a direct reflection of the leader (Baxter, 2017).

Bradshaw et al (1996) theorise that women tend to use more interactive practises within leadership and place a higher value on more 'tacit' leadership. Bradshaw et al (1996) further speculate that women value a more democratic and participative leader and are therefore attracted to a 'female-centric' enterprise when becoming a leader. These theories appear to be corroborated by Davies et al. (2017) as they found that self-selection can be contributing factor in the lack of women in leadership roles. Women choose not to join the leadership team (though well qualified to do so) as they feel they do not 'fit' within the current leadership culture. A theory that appears to be supported by Garcia-Cano et al. (2016) as they also believed that the motivation for women to lead within the non-profit sector may be driven by the role culture within the organisation; and that this can be as powerful as the personal motivation for volunteering. They further re-iterate this by considering that women consider service to others and providing basic human needs to be of a high importance (Themundo, 2016 as cited in Garcia-Cano et al., 2016). In contrast men are more attracted to opportunities that offer the chance of higher earnings, promotion, freedom and power; this could be a contributing factor for a greater number of men in

leadership in larger organisations as they offer a greater chance of achieving these desires (Hernandez Bark et al., 2016), therefore as small and micro organisations are rarely able to offer remuneration they are dismissed. Bussell and Forbes (2001) believed that this ‘selective intent’ was driven by self-esteem and the egoistic motives that prestige and the approval of others can bring.

Metcalf and Woodhams (2012) theorise that the ‘pursuit’ of these cultural norms produced “hegemonic masculinity” (p.127) which when remaining unchallenged will continue to affect the diversity that the non-profit sector thrives on. As this discrimination is not as prevalent in small and micro organisations, women do not feel silenced in the workplace (Baxter, 2017) and the voluntary organisation become more attractive to female leaders.

It is therefore important to note that the culture of an organisation and its cultural bias can have an effect on the motivation of women to lead within the organisation. An appreciation of the leadership traits of women and the effect that these traits can have on the wider culture of the organisation are all areas that should be taken into consideration.

When looking more at culture and the cultural norms within an organisation and how these affect the motivation of female leaders, the influence of ethical concerns cannot be ignored. Voluntary / Charity / Non-profit / Humanitarian organisations are thought of as being naturally ethical and promoting gender equality (Damman et al., 2014) but as we have seen so far that is not always the case, and the lack of affirmative action can be thought of as an ethical dilemma for the sector. Business ethics are often thought of as at odds with feminist and care ethics and are therefore potentially at odds with the motivation of the leader. Business ethics frequently call for the leader to have experience in the organisation (Borgerson, 2007) and tend to be inappropriately subjective which can be juxtaposed to the feminist ethic of connection to others – this seemingly contrasted position discourages female

leaders as they may feel that they are unfit or unable to achieve cohesion within the organisation. This appears to reiterate the findings of Davies et al. (2014) who found that the ability to 'fit-in' was a strong motivational factor.

Though it is important to note that feminist ethical views are not necessarily unique to women and are not feminine trait based, though there does appear to be some synergy between the two in the case of non-profit female leaders. Carrasco et al. (2015) believe that gender diversity within the not-for-profit sector is an ethical issue and highlights the effects of business ethics on structure and the appointment of leaders. They raise concerns that institutional isomorphism prevents the recruitment of women leaders in the larger charities and this prevents more women from volunteering to lead within them (Dimaggio & Powell, 1983 as cited in Carrasco et al., 2015). Borgerson (2007) notes that the stereotype of the female volunteer leads to female 'oppression' within the enterprise and plays on the traditional view that women who 'work' in charities are passive, sensitive and emotional as they are focused on the well-being and care of others. Although this may be the widely held view of a strong ethic of care, it is much more focused on, what is seen as, obligation to others and interpersonal relationships (Borgerson, 2017) and through these relationships the normalisation of ethical behaviour (Tanner et al., 2010).

This normalisation of ethical behaviour and being empathetic to the needs of self and others can be seen in Authentic leadership. These leaders act in accordance with their internal thoughts and show their 'true-selves' through their actions (Tanner et al, 2010). This echoes the thoughts of Alfes et al. (2015), Babchuck et al. (1960) and O'Brien et al. (2010) who theorised that positive engagement reduces the psychological effects of volunteering work, and the desire to be a volunteer allows 'true – self' to be exposed. The altruistic values held by an authentic leader (protecting the rights and dignities of others) echo the feminine traits that are at the heart of the ethic of care and therefore can be potentially thought of as a

strong motivation to lead. As noted by Burggraeve (2015) to 'do more' than duty demands (supererogation) helps life to find meaning as it is a side effect of truly being engaged.

Although it is easy to make assumptions that ethics and ethical values are the cornerstone of leadership within a non-profit organisation it is clear that there is a fine line between the ethics of the leader and the ethics of the business. If one is fundamentally different from the other then there will be more reticence when it comes to women leading and volunteering within the organisation. We will next further explore how leadership styles and values influence leadership choice and the motivation to lead.

Leadership theory is dominated by male paradigms and a consequence of this is that organisational meaning, leadership theories and styles are influenced and dominated by men and masculinities (Alonso-Almeida et al., 2017). It is theorised that women and men have very different leadership styles and values (Alonso-Almeida et al., 2017; Sahin et al., 2017; Whetstone, 2002). These styles and values are governed by personality, upbringing and environment. Another factor that influences leadership style, as previously noted, is the issue that women leaders are viewed differently to their male counterparts due to stereotypes and societal expectations (Baxter, 2017; Andreassen et al., 2014). This can result in women adopting a more masculine leadership style; which consequently can result in a perpetuation of the stereotypes. Whetstone (2002) theorised that women are more 'successful' and 'comfortable' adopting a transformational leadership style. This is heavily influenced by charisma and the ability to motivate followers through motivation (Whetstone, 2002). This is supported by Fritz and Knippenberg (2017), who hypothesised that mutual aspirations and shared communication, especially in the non-profit sector, encouraged more women to act. This positive role modelling also encouraged and stimulated more women to aspire to lead within these types of organisation (Fritz & Knippenberg, 2017). Whetstone (2002) also pondered as to whether the pragmatic nature of the non-profit sector also encouraged and

motivated women to lead, as noted earlier the moral climate, and 'feel' of the organisation is a great influence on women when looking to volunteer but this is also applicable on the aspiration to lead Parsons and Broadbridge (2006).

Bamiatzi et al. (2015) believe that leadership within small organisations is significantly more important than in larger organisations. This is due to the limited numbers of leaders within the organisation and the fact that responsibilities, reporting lines and boundaries can become blurred (Bamiatzi et al., 2015). These organisations require a more situational and fluid leadership style rather than a strict authoritarian style (Bamiatzi et al., 2015) in order to facilitate the nature of the business. This flexibility of leadership is supported by Alonso-Almeida et al. (2017) who value adaption of style in order to accommodate different environments. This is posited as a more entrepreneurial management style and found more commonly in those who favour transformational leadership (Sahin et al., 2017) as the balance of philanthropic values can be dependent on the creation of community and having a psychological engagement with followers (Palumbo, 2016). Knipfer et al. (2016) believe that women are driven to lead by three factors; motivation, ability and opportunity. These factors are different to men who look at opportunity and reward as more influential in the pursuit of leadership (Hernandez Bark et al., 2016). This 'aspiration to serve' is thought of as a motivation to lead by Fritz and Knippenberg (2017) and can empower not only the followers but also the leader themselves (Dean & Ford, 2017) drawing on that leader and their own self-belief to use their abilities to act for the collective (Whetstone, 2002). This altruistic leader does things because their actions offer them greater positive benefits than the costs incurred (Becker, 1976 as cited in Whetstone, 2002).

It is therefore clear so far, that leadership style as well as both ethical and personal values all influence the female desire to lead. It also seems that values are of greater influence in the non-profit and volunteer sector. Therefore, the positive aspects of the

organisation and the reputation and 'feel' of the business will heavily influence the desire to progress and lead within the organisation. Using the findings so far, motivation to lead will now be explored and how different types of motivation factors into the decision-making process and influence the desire of women to lead within the small/micro non-profit organisation.

There is limited research available as to the specific motivating factors of leadership in the non-profit sector specifically focusing on the small and micro organisation, therefore general theories have been explored and analysed. Buelens and van den Broeck (2007) stated that motivation is not a passive notion, that there is a strong desire to serve the 'public interest' when leading within the non-profit sector and that this high level of commitment is a choice, and that choosing to give and being motivated to do so is influenced by many factors. A general consensus is observable in many theories as to why people volunteer and lead within non-profit organisations. These are split into two models; a 'warm glow' (Proteau & Wolff, 2008) – the motivation to give themselves for a greater cause (Bruno & Fiorillo, 2012; Bussell & Forbes, 2002; Felfe & Schyns, 2014) or for investment – to increase employability and future earnings or to improve human capital (Bruno & Fiorillo, 2012; Kuvaas et al., 2017; Profiroiu & Pacesila, 2017), and all other motivations fall into one of these two categories. Elprana et al. (2015) further expanded on this by building on the concept of the motivation to lead (Chan & Drasgow, 2015 as cited in Elprana et al., 2015) by speculating that as well as the general consensus as to why people lead within non-profits; this motivation was predictable based on personality, sociocultural values, self-efficacy and leadership experience and that these potentially could be a reflection of society and a reflection of the gender equality within the organisation. Jenni (2017) corroborates this premise by suggesting that personal values, views and personality traits shape the way the world is viewed as a whole and this is at the core of why women volunteer and lead. Putting all these factors

together it is possible that, a female-centric, 'people-friendly' organisation is more likely to motivate volunteers to step-up and lead. This theory appears to be supported by Garcia-Cano et al. (2016) as they too believed that motivation may be influenced by gender systems and role culture within the organisation.

Garcia-Cano et al. (2015) appear to build upon these theories, as they believe that as well as the six motivational factors noted earlier; sociodemographic factors will also influence whether volunteer leaders give themselves for altruistic or pragmatic reasons. Furthermore, this influence can change with age, social position and familial influences. Mascia et al. (2015) validate this notion as they note that behaviours (of individuals) can morph in order to support new beliefs and the influence of external (to self,) collaborators can stimulate new beliefs and motivate to step forward and lead. An example of this can be seen in a mother supporting a child's sports team and becoming a driving force in fund raising and organising others to support the team, when previously they had no interest in sport or leading others. Bruno and Fiorillo (2012) observed that the care of family and household can affect the reasons for volunteering (Muelleur, 1975; Schram & Dunsing, 1981, as cited in Bruno & Fiorillo, 2012). This was classed as Family Unit Collective Goals by Bussell and Forbes (2001) and contributed in the continuance of volunteering within a family and normalised volunteering behaviour within the familial history. Jenni (2017) expanded on this by speculating that 'situation' is a primary mitigating factor in motivation, and that there is, as noted previously, usually a trigger event that begins the journey to lead, whether this is an interest in sport, or a family member requiring hospice care.

As well as the 'warm-glow' (Proteau & Wolff, 2008) there are other more pragmatic motivations – the Investment in self. Burani and Palestini (2016) called this the 'donate labour hypothesis' as labour is donated, but as skills increase and improve the leader 'gets back' as much as they 'put-in'. The increase in 'interesting' work and the development of

new skills become an intrinsic motivation to move through the ranks of an organisation - from volunteer to leader (Bruno & Fiorillo, 2012), this improvement in Human Capital is more common in younger women (Bussell & Forbes, 2001) as they meet and learn from others and create both a support and business network which can help to shape a future career. Profiroiu and Păceșilă (2017), note that this is particularly observable in students as they desire to improve career opportunities. Though they did note that contrary to many theorists that in small and micro organisations specific skill sets were not a necessity in order to become a leader.

There are many factors that can influence whether a woman becomes a leader within a non-profit organisation including empathy with the cause, prestige, external collaboration and situation. Bussell and Forbes (2001) also suggested that the primary driving motivation may be as simple as “because I can”. It is clear to see that there is agreement within the theories that motivation to lead is a deeply personal thing, influenced by history, personality, values and family. With regard to women or men, motivation to lead can also arise out of practical instrumentality: to feel good, to learn, or to assert one’s own autonomy. These initial findings provide some new insight but will require further inquiry in other contexts and through empirical design before more general conclusions can be ascertained.

Limitations

This study is limited particularly in scope as few empirical studies address specifically female leadership in the voluntary sector; most research explores more general gender issues and as it has become clear there are specific differences between the genders in this case. Secondly, extant literature concentrates on the voluntary/ non-profit sector as a whole and doesn’t differentiate according to the size or budget of the enterprise. Factors such as these may have a major impact on the influence and motivation of women to become leaders,

which was reflected in the reports that are available. Thirdly, in most recent years signs of potential change in public perceptions and acceptance of gender hierarchies especially in the context of the workplace. Such trends hold the potential to create changes at a social level and the academic literature has yet to catch-up. Findings and implications are limited in scope further by the geographical focus and the exclusion of 'grey literature' from the study. The use of specific geographical limitations reduced the available literature and thus constrained the availability of empirical data. Due to the nature of the volunteer sector, government agencies and publications by the third sector organisations themselves may have provided additional data for analysis. Government papers and information from other industrialized nations may also provide a broader picture and a wider set of data to draw on. Finally, this study is limited by the nature of secondary research. At this point the study sought to gain an overview of the current state of knowledge and identify gaps toward the development of proposals for further research with primary data collection in view.

Implications and Recommendations

This study exposes a gap in the fields of gender and leadership as well as in the motivation to lead. Furthermore, the systematic literature review contributes specific insight into the motivation to lead in the volunteer sector and indications for diversifying traditionally male- or female-dominated workforces. This study expands the work of Lee (2014) and Prouteau and Tabariés (2010) which examined the voluntary sector as a whole rather than looking specifically at the size of the organisation and focused on contexts outside of the UK. In exploring the motivation of women to lead in small and micro not-for-profit organisations in the UK, findings show when remuneration and monetary reward is not a factor in leadership other factors come into play and differentiate the motivation to become leaders between women and men. This review indicates that there is a difference in the

motivation of women and men to lead in the non-profit sector in the UK that is delineated along ethical motivation. The overarching theme from studies included in this review shows a fundamental difference in the core values of men and women. Both men and women are influenced by others in their choice to become a leader in this context, but for different reasons: men by more ego-centric beliefs and to raise prestige amongst their peers and women by a need to fit in and be part of the group.

Analysis from this review points to a direct link between personal values and those of the organisation; any deviation in these beliefs can result in women becoming reticent to lead within these organisations as they believe their views are undervalued. Overall, the review indicated that men were driven by pragmatic interests and ego; whereas women were motivated through the opportunity to be change agents both for themselves and for others. Whilst it is easy to make assumptions as to the factors that motivate women to lead within small and micro organisations, but the reality of their motivations is far more complex than the common stereotypical perceptions related to family pressures, lack of confidence, or helper syndrome. Women are influenced by an array of factors with subtle nuances. Nevertheless, the extant literature that was included in this review demonstrates that women aspire to lead in the context of voluntary organisations and particularly in small and micro social enterprises because they believe in the cause and feel ethically driven by the potential to be agents of change: making a difference to both the organisation, the cause it serves, and themselves.

The findings of this review pose implications for recruitment and development of leaders in the volunteer sector and provides further indications for diversifying executive positions. Boards and organisations seeking to foster women's leadership or to promote diversity in leadership can draw on these findings to develop recruitment and leadership development interventions that draw out the elements of leading social enterprises which

appear to appeal to women and minimize the elements that would tend to attract men to those roles. Alternatively, organisations can examine their culture and assess the degree to which it fosters an environment supportive of women's leadership development that is guided by the role of being a change agent, making a difference, being part of a community, and asserting autonomy.

Following the advice of Baumeister and Leary (1997) on formulating rather than testing or supporting hypotheses for future possible research via systematic literature review method, we make the following proposals as an initial attempt to conceptualize further study:

Proposal 1 –

Women more frequently become leaders in small and micro non-profit organisations due to familial and peer influences relating to a need for affiliation and social integration.

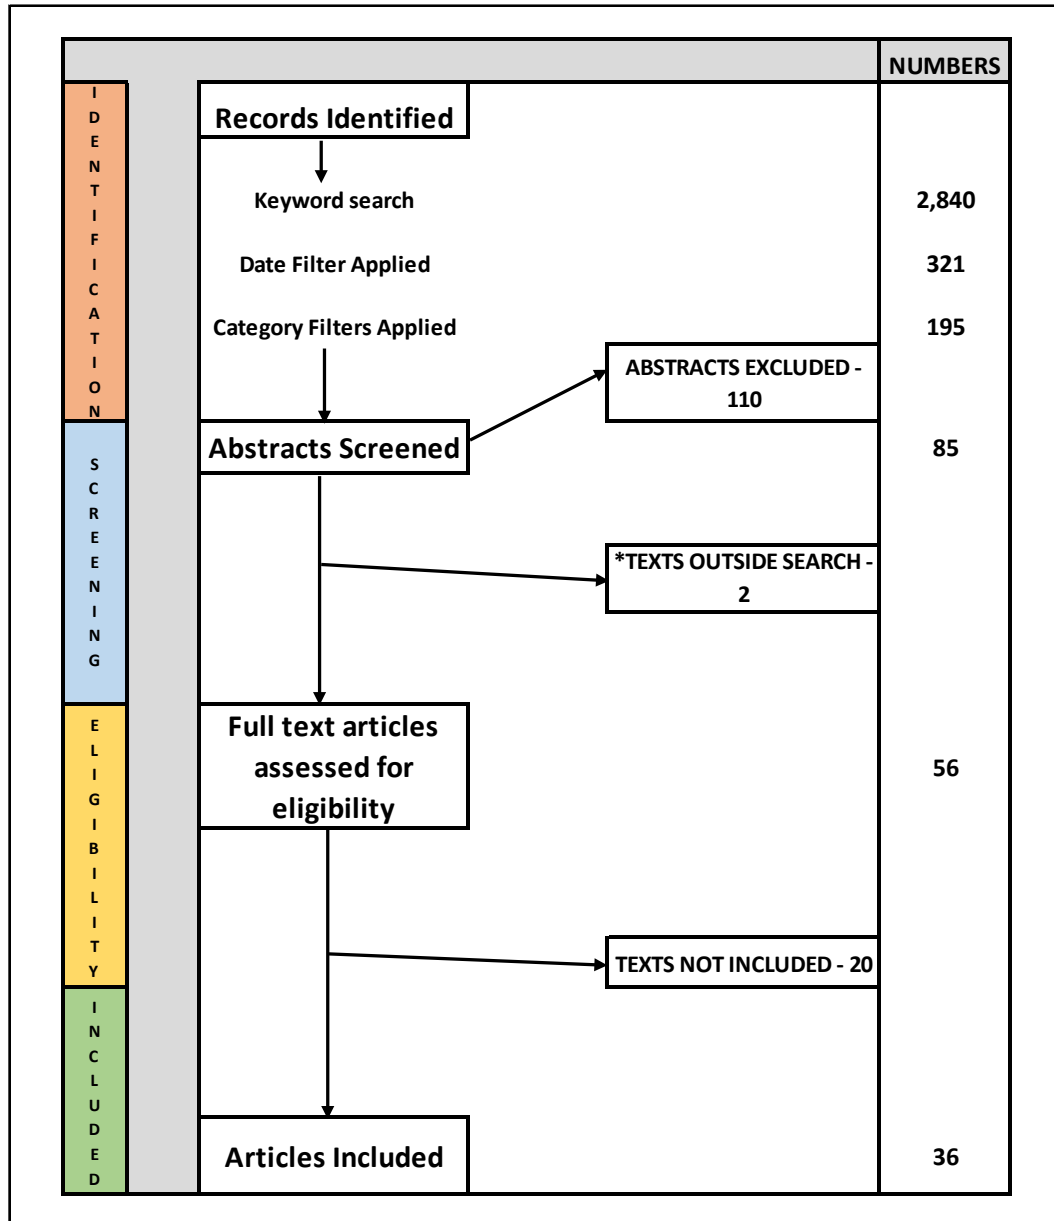

Proposal 2 –

Women more frequently become leaders in small and micro non-profit organisations due to a need assert their agency toward ethical and moral concerns that provide meaning.

Moving forward we recommended further conceptualization of targeted research projects in to these underexplored phenomena. Whilst this systematic literature review provides some insight into women's motivation to lead in small and micro third sector organisations, there is still a need to explore empirically the antecedents of leadership in social enterprises as well as the ethical dimensions of the motivation to lead with further examination of gender differences in leadership and motivation to lead in the context of volunteer service. Further study should provide more in-depth critical evaluation of gendered assumptions and the role of socialization that underpin outcomes and behaviours in non-profit sector leadership which is beyond the scope of this study.
